

## Fish Passage Center

# Weekly Report #98 - 14

June 19, 1998

2501 SW First Ave., Suite 230  
Portland, OR 97201-4752  
phone: 503/230-4582  
fax: 503/230-7559

### SUMMARY OF EVENTS:

**Water Supply:** Distribution of the cumulative precipitation for the October through June period remained similar to last week. The sites with the highest precipitation in the basin are still in the Middle Snake basin and in Upper Deschutes/Crooked. The areas with the highest precipitation for the period of October through June were Harney/Malheur Basin with 147%, Owyhee/Malheur Basin with 141%, the Upper Deschutes with 133% of average and the Klamath basin with 132% of average. The lowest amount was 92% of average at NW Slope Washington Cascade and 92% at the Columbia above Castelgar. Areas with precipitation lower than average remain the Washington Cascades and Upper Columbia Basin. Observation of the precipitation in the entire basin during June 1 through 16, shows a continued decreasing trend compared to precipitation in May, except in the Upper/Middle Snake Basin. The area with the highest precipitation remained the Upper Snake with 229%. Owyhee/Malheur basin, Klamath Basin and Flathead are the areas with high precipitation in the range of 148 to 169%. The area with the lowest precipitation remained SW WA Cascades/Cowlitz with 51%. Precipitation in the Columbia above Coulee was 131% of the average, the Columbia above The Dalles was 126% of the average and the Snake River above Ice Harbor was 139% of the average for the period of June 1 through 16.

**System Storage:** Precipitation increased during last week in the entire basin and flows increased for a few days last week. It is expected that flows will now continue to decrease throughout the season. Major US reservoirs in the system are almost full or full. The Snake river reservoirs continue passing high inflows. Canadian reservoirs continue to refill.

A summary of actual elevations is shown in the following table:

Reservoir	Actual Elev. [ft] 6/17/98	Max. Pool [ft]
Mica	2435.1	2475.0
Arrow	1430.5	1444.0
Duncan	1860.8	1892.0
Libby	2451.1	2459.0
Hungry Horse	3558.95	3560.0
Grand Coulee	1287.9	1290.0
Brownlee	2076.9	2077.0
Dworshak	1599.6	1600.0

- Mica continues with the same operations as last week. Actual outflow continues to be 0 kcfs. The current treaty elevation is 2432.7 ft. Water continues to be stored in the Non Treaty accounts of BPA and BC Hydro at a rate of 5 kcfs on each side. Currently there are 1009 ksfd in the US account and 951 ksfd in the BC Hydro account. It is projected that Mica will continue with the same operation to the end of June.
- Arrow continues with operations that will lead to refill by the end of July. Current actual elevation remains at about 7 ft below the Treaty elevation. Current outflow continues to be 16 kcfs. The requested minimum outflow is 20 kcfs below Arrow to protect the trout redds. However, because of the continuation of high Kootenai river inflows, an outflow of only 16 kcfs is needed from Arrow. Trout redds are protected because of the upstream backwater effect of Kootenai River. As projected, Treaty discharge is 26 kcfs, the difference between actual and projected treaty discharge of 10 kcfs is stored in Treaty storage and planned

to be released by the end of July when the flows in the system are projected to decrease significantly.

- Duncan continues to refill to the end of July full pool elevation with an outflow of 100 cfs. Treaty elevation at Duncan is the same as actual.
- Libby continues with similar operations as last week: to provide constant flows of 25 kcfs at Bonners Ferry through June 25. The actual outflow is projected to be in the range of 20-22 kcfs.
- Hungry Horse is releasing outflows up to 7.2 kcfs, and is almost full, a foot below full pool elevation.
- Grand Coulee will operate between 1287 and 1290 ft to the end of next week, with projected average outflows at Priest Rapids of 100 kcfs.
- Brownlee is full and continues to pass inflow in the range of 40 kcfs.
- Dworshak is full and will continue to pass inflow in the range of 7-9.5 kcfs.

Upper Snake reservoirs:

The system continued to be operated for flood control due to the high precipitation in the area. The flows are in a slower recession compared to the previous week. Irrigation demand continues to be at minimum.

Jackson Lake was refilled up to 93% of full and currently is releasing 3.3 kcfs.

Palisades was refilled up to 87% of full. Currently, the outflow is 14 kcfs.

American Falls is full and will continue to pass inflow of 18.9 kcfs through the end of the next week.

Millner flow, at the lowest point of the Upper Snake system, continues to decrease with outflows of 9.3 kcfs, compared to last week flows of 11 kcfs. Irrigation withdrawal upstream of Minidoka remained similar to last week, up to 6.6 kcfs.

Boise River Basin:

All three major reservoirs: Anderson, Arrowrock and Lucky Peak are full and the system is basically passing inflow. Irrigation demands are at a minimum, about 300 cfs. The

flow at Glenwood Bridge is 3.6 kcfs and 2.4 kcfs at New York Canal.

**System Streamflow:** The weekly average flows continue to be in recession in the entire basin. Flows at Priest Rapids were highly fluctuating between 109.5-196.9 kcfs during the period of June 11-17. The summary of average weekly flows for the run of the river projects during the June 5-18 period is shown in the following Table:

Project	June 5-11	June 12-18
Priest Rapids	204.5 kcfs	147.6 kcfs*
McNary	332.8 kcfs	264.2 kcfs*
Lower Granite	129.3 kcfs	118.5 kcfs
Bonneville	349.6 kcfs	276.9 kcfs

\* for the period of June 12-17.

**Spill:** Flows in the Snake River have continued to recede slowly this past week and spill levels decreased through the week. Most excess hydraulic capacity spill ended as the Biological Opinion Spill Program resumed. Spill averaged 31.5 kcfs, 38.3 kcfs, 18 kcfs and 64.4 kcfs at Lower Granite, Little Goose, Lower Monumental and Ice Harbor dams, respectively. Biological Opinion spill will end for the spring season at Lower Granite, Little Goose and Lower Monumental dams on June 20. Summer spill will begin on June 21 at Ice Harbor Dam.

Spill at the lower Columbia projects decreased coincident with the decrease in flow over the past week. Spill averaged 107.1 kcfs at McNary Dam, 70.9 kcfs at John Day Dam, 122.6 kcfs at The Dalles Dam, and 96.8 kcfs at Bonneville Dam over the past week.

Total Dissolved Gas Supersaturation and gas Bubble Trauma Monitoring

TDGS levels are generally at, or below, the gas waivers at all sites.

Gas bubble trauma monitoring has shown few juvenile fish with signs throughout the system. The percentage of fish affected remains well below the action criteria.

**Smolt Monitoring.** *Snake River Drainage.* All juvenile migrant collection traps have completed sampling for the 1998 season. Yearling chinook, coho and sockeye continue at about the same levels as last week at Lower Granite, Little Goose, and Lower Monumental dams. The passage indices at the Snake River projects are dominated by hatchery steelhead, which ranged from 2,700 to nearly 12,000 fish at Lower Granite Dam this past week. Wild subyearling chinook numbers were fairly steady at the Snake River dams with passage indices ranging 97 to 332 fish. PIT tagged hatchery subyearling chinook are not adipose clipped and will be counted in the sampling at the dams as wild chinook. As normal, any fish found with adipose clips will be listed as hatchery subyearling chinook.

*Columbia River Drainage.* The passage indices at Rock Island Dam are reduced for yearling chinook, coho, steelhead and sockeye compared to the previous week. Subyearling chinook increased steadily through the week.

At McNary Dam, the decreasing trend in passage indices of yearling chinook, coho, steelhead, and sockeye continued. The juvenile bypass system at McNary was repaired and sampling resumed on June 12<sup>th</sup>. Passage indices for subyearling chinook increased through the week and exceeded 105,000 by week's end. Passage of yearling migrants at John Day and Bonneville dams continued to decrease for all species during the week. Subyearling chinook increased and averaged about 30,000 for the week at John Day Dam. At Bonneville Dam, passage indices of subyearling chinook increased somewhat from the past week's average.

**Adult Fish Passage:** At Bonneville Dam, numbers of adult summer chinook ranged from 409 to 599 through the week of June 12 through 18. The cumulative count at Bonneville Dam through June 18 was 7328, about 58% of the 1997 and nearly equal to (7,363) the 10-year average. The early counts of summer chinook at Bonneville Dam are fish normally destined for the Snake

River, with the Mid-Columbia summer chinook dominating the counts after mid-June. All chinook passing Snake River dams are now being counted as summer chinook, with Rock Island Dam beginning its summer chinook count on June 18. Counts of summer chinook into the Snake River have in general ranged between 200 and 300 per day at each project. The first day of counting summer chinook at Lower Granite was 316 on June 18. The Ice Harbor Dam count of summer chinook was 2,048 or about 65% of the McNary Dam count to date.

The adult spring chinook count at Lower Granite Dam ended with 9,881, about 29% of the 1997 count and 65% of the 10-year average. The Rock Island count of 3,270 for spring chinook was reduced from the 1997 and the 10-year average as well. These low totals of returning adult chinook indicate that the spring chinook run remains very depressed in both the Snake and the Mid-Columbia River.

The steelhead run for the 1998/99 cycle ranged between 120 and 221 for this passage week at Bonneville Dam. About 40 to 75 per day were passing the lower Columbia dams through McNary Dam. The season count at Bonneville Dam in the period of March through June 11 was 5,401, and remains well below the 1997 and 10-year average to date.

Sockeye are now passing Bonneville Dam in increasing numbers; however, this year's run appears to be very weak compared to most sockeye runs in previous years. The high daily count for the week was 341 on June 18, the final day of the reporting week. The cumulative count through June 18 was 1,226, about 34% and 25% of the respective 1997 and 10-year average.

**Hatchery Releases:** Columbia Basin hatcheries will continue to release subyearling summer and fall chinook in fairly high numbers through the end of June. In the Mid-Columbia Reach, subyearling fall chinook from Priest Rapids Hatchery will be released on five separate days (normal is three days apart) beginning June 12 and ending on June 24. Wells Hatchery completed release from their ponds on June 15. Turtle Rock and

Ringold Hatcheries are slated to release fish beginning next week, with the combined total of 4.5 million. The Yakama acclimation ponds should be empty as of June 12, with many of the fish now passing McNary and John Day dams. Subyearling fall chinook released in the Snake River are from Pittsburg Landing and Big Canyon Acclimation Sites with no fish released from Lyons Ferry Hatchery (on-site). These fish were used as part of the survival studies that are ongoing in the Snake River. All fish from the acclimation ponds were PIT tagged this year. In the lower Columbia River, subyearling releases of fall chinook from the Umatilla River Basin were completed by the end of May. Klickitat Hatchery opened tail screens in mid-May and have allowed the fish to volitionally emigrate from the ponds (final end date will be mid to late June). Subyearling fall chinook from Little White Salmon Hatchery will be released in late June (scheduled for June 25 and June 26).

The data presented in the following passage index section is preliminary and has been derived from various sources. For verification and/or origin of data, contact the operators of the Fish Passage Data System at (503) 230-4099.

Smolt indices, wild & hatchery or combined, are presented in the following order: yearling chinook (chinook 1's), subyearling chinook (chinook 0's), steelhead, coho, and sockeye. Two classes of fish counts are shown in these tables: collection counts, which account for sample rates but are not adjusted for flow; and passage indices, which are collection counts divided by the proportion of water passing through the sampling system. Collection counts may be constrained due to sampling effort or river flow. Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations. The classes of counts presented in the report are defined below for each site. Most samples occur over a 24 hour period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

LEW and WTB data collected for the FPC by Idaho Dept. of Fish and Game.

JDA and BO1 data collected for the FPC by National Marine Fisheries Service.

RIS data collected for the FPC by Chelan Co. PUD/Washington Dept. of Fish and Wildlife.

LGR, LMN, and MCN data collected for the FPC by Washington Dept. of Fish and Wildlife.

LGS and GRN data collected for the FPC by Oregon Dept. of Fish and Wildlife. IMN data collected for the FPC by the Nez Perce Tribe.

Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.

1996, 1997, and 1998 counts were obtained from the Corps of Engineers.

1998 totals at LMN, RIS, and RRH are based on video counts accumulated through June 17.

1998 totals at LGS are based on video counts accumulated through June 16.

Adult count records at LGS have been maintained since 1993.

\*\* - Through June 28, all (spring) chinook are being trapped and removed from the ladder at Wells prior to the counting window.
