

Fish Passage Center

Weekly Report #98 - 19

July 24, 1998

2501 SW First Ave., Suite 230
Portland, OR 97201-4752
phone: 503/230-4582
fax: 503/230-7559

SUMMARY OF EVENTS:

Water Supply. Summer weather continues. Peak maximum temperatures were reaching 5 to 16 degrees above normal with heating focused particularly in Southeastern Idaho. Some parts of the Upper Columbia basin enjoyed cooler northwestern flow from Canada.

System Storage. US reservoirs commenced BiOp required summer augmentation drafting for endangered Snake River salmon. The Canadian reservoirs continue to refill by the end of July according to the Treaty Detailed Operating Plan.

A summary of actual elevations on July 23, 1998 is shown in the following table:

Reservoir	Actual Elev. [ft] 7/23/98	Max. Pool [ft]
Mica	2459.70	2475.0
Arrow	1437.90	1444.0
Duncan	1887.40	1892.0
Libby	2457.91	2459.0
Hungry Horse	3341.67	3560.0
Grand Coulee	1285.10	1290.0
Brownlee	2062.69*	2077.0
Dworshak	1580.32	1600.0

as of July 22, 1998

Canadian reservoirs:

- Mica continues to refill, releasing Treaty storage at a rate of 10 kcfs. The actual outflow is projected to be between 10-30 kcfs depending on the dynamics of the Non-Treaty releases. The Non-Treaty US account as of July 23 was 1.99 MAF and BC Hydro was 1.91 MAF. It is expected that BPA will release the first part of the Non-Treaty water stored during May-June period of about 324 KAF by the end of July. BC Hydro is also planing to release according to the NTSA the volume of 324 KAF by the end of

July. BPA will have, approximately, an additional 300 KAF from Non Treaty storage to release during August. BC Hydro doesn't have any further obligations to release additional Non Treaty storage during August.

- Arrow Treaty storage is full. The Treaty releases are about 33 kcfs. Actual releases are projected to be in the range of 33 kcfs to 53 kcfs during next week.
- Duncan continues to refill, releasing 0.1 kcfs. It is projected that the reservoir will be full by the end of July.

US reservoirs:

- Libby started drafting for summer augmentation flows at a rate of 12-14.6 kcfs. It will continue with drafting at a rate of approximately 12 kcfs. It is expected that agreement on the Libby/Arrow swap will be reached any day, resulting in an end of August elevation of 2447 in stead of 2439.
- Hungry Horse continues summer augmentation operations with outflows of 7.2 kcfs while meeting the flow level of 3.5 kcfs at Columbia Falls. The project will draft to elevation of 3540 ft by the end of August.
- Grand Coulee will operate to support McNary flows of minimum 190 kcfs for the next week. It is expected that elevation on August 2 will be 1283 ft.
- Brownlee continues augmentation drafting with out flows of 19-20 limited to one foot per day draft rate for recreation concerns.
- Dworshak will continue with outflow of 20 kcfs which has been started on July 21. The project will operate to meet the weekly flow objective of 52 kcfs at Lower Granite. The project releases will be managed to

provide water temperatures of 48° F for maintaining steelhead production in the hatchery downstream of the dam.

Upper Snake reservoirs:

It is the high irrigation season. The system continues to be operated primarily for irrigation demands. Temperatures continue to be high and irrigation withdrawals are increasing. Surface runoff continues to decrease.

Jackson Lake is currently passing inflow of 2.5 kcfs.

Palisades initiated drafting for Upper Snake diversion, with irrigation withdrawal at a rate of 13.5 kcfs.

American Falls continues drafting to provide irrigation diversion flow downstream at Minidoka. Current outflow is 13.04 kcfs, about 9.5 kcfs higher than inflow.

Millner flow, at the lowest point of the Upper Snake system, is at constant rate of 1.5 kcfs since July 7. Irrigation withdrawal upstream of Minidoka increased to a rate of 9.1 kcfs. Irrigation withdrawal at Upper Snake diversion, upstream from Blackfoot also increased to 10 kcfs.

Boise River Basin:

Anderson and Arrowrock began drafting for irrigation withdrawals. Current reservoir capacities are 96% of full and 87% of full. The flow at Glenwood Bridge remained about 1.3 kcfs.

System Streamflow. The weekly average flows for the Snake River continue to recede. Mid Columbia flows remained approximately at the same level as last week. Flows at McNary continue to be below summer target flows of 200 kcfs. The summary of average weekly flows for run of the river projects during the July 10-July 23 period is shown in the following Table:

Project	July 17-23	July 10-16
Priest Rapids	138.3 kcfs	132.4 kcfs
McNary	190.5 kcfs	198.3 kcfs
Lower Granite	54.8 kcfs	63.1 kcfs
Bonneville	197.4 kcfs	207.7 kcfs

Spill. Spill above hydraulic capacity continues at Dworshak Dam as flow augmentation is implemented. The summer surface bypass test at Lower Granite Dam ended and the spill associated with the test ended. In the Lower Snake River the summer spill program is being implemented at Ice Harbor Dam. Spill averaged 47.9 kcfs at Ice Harbor Dam over the past week.

The lower Columbia River summer spill program began on July 1, 1998. As flows decreased the amount of spill occurring at McNary Dam in excess of hydraulic capacity decreased considerably. Spill averaged 27.8 kcfs at McNary Dam, 49.8 kcfs at John Day Dam, 89 kcfs at The Dalles Dam, and 89.7 kcfs at Bonneville Dam over the past week.

The summer spill program is being implemented at the Mid Columbia projects.

Total Dissolved Gas Supersaturation and gas Bubble Trauma Monitoring

TDGS levels have been at, or below, the gas waivers at all monitoring sites. Gas bubble trauma monitoring has ended for the season at the Snake River monitoring sites. Sampling will continue through the summer at Rock Island, McNary, John Day and Bonneville dams. No juvenile salmon have been detected with signs over the past week.

Smolt Monitoring. *Snake River Drainage.* Wild subyearling chinook passage indices at Lower Granite Dam dropped from above 2,000 fish to an average of 1,152 per day during the last five days of this week. Both hatchery and wild PIT tagged fall chinook detections at Lower Granite Dam have decreased since mid-July.

This week's wild subyearling chinook passage indices have decreased more rapidly at Lower Monumental Dam than at Little Goose Dam.

Columbia River Drainage. In the Mid-Columbia River, this week's subyearling chinook passage indices at Rock Island Dam are slightly higher than last week's level. In the lower Columbia River, subyearling chinook passage indices at McNary dropped from last week's average of 300,000 fish to below 100,000 fish in three of the four last days of this week. While in the lower Columbia River at John Day and Bonneville dams, there was little change this week in passage indices of subyearling chinook from last week's level. The relative magnitude of Snake River fall chinook passage at McNary Dam has changed little from last week.

Adult Fish Passage. At Bonneville Dam, the number of adult summer chinook ranged from 324 to 207 through the week of July 17 through July 23. The cumulative count at Bonneville Dam through July 23 was 19,767, about 75% of the 1997 and 101% of the 10-year average. The count of summer chinook at McNary Dam was 14,895, about 77% and 102% of the respective 1997 and 10-year average. The turnoff into the Snake River (Ice Harbor Dam count) totaled 5,395, 60% and 121% of the 1997 and 10-year average at the project. Daily counts of adult summer chinook decreased to less than 20 fish per day by week's end at the Snake River projects. The cumulative count of summer chinook at Lower Granite Dam was 4,273 through July 23. The cumulative count of summer chinook at Priest Rapids Dam was 11,491 and this total was more than the 1997 and 10-year average through July 23. Of the approximate 8,500 that have passed Rock Island Dam, about 45% have continued past Rocky Reach Dam.

The steelhead run at Bonneville Dam remained at nearly 1,100 to 1,200 fish per day for this passage week at Bonneville Dam. The season count at Bonneville Dam from March 15 through July 23 was 31,587, and remains below either the 1997 or the 10-year average to date. Of the steelhead above Bonneville Dam, about

11,000 have passed The Dalles Dam. As normally occurs, a portion of the fish will begin seeking cooler water in some of the tributary streams because of the high water temperatures that currently exist in the mainstem Columbia River. Steelhead are still continuing to migrate upstream, with the McNary count through July 23 at 8,204. The Ice Harbor Dam count was 4,499 to date, with the weekly daily passage counts normally between 50 and 100. The number of steelhead at Priest Rapids has been increasing, with the high daily count occurring on July 23 at 46, and the season total at 410.

Daily sockeye counts at Bonneville Dam decreased over the week to less than 50 per day by week end, with the total to date of 12,751. The run this year is approximately 28% and 25% of the 1997 and 10-year average count, respectively through July 23. The sockeye passage at the Mid-Columbia projects remains at relatively high levels, with the cumulative count for the season at Priest Rapids Dam now 10,961. When compared to the 1997 and 10-year average, the 1998 sockeye run is way below the norm. So far it appears that the number of sockeye destined for Lake Osoyoos will exceed those migrating to Lake Wenatchee; however, this could change through the next few weeks.

The following information was received from the WDFW fish count supervisor concerning passage of sockeye into the Snake River at Lower Granite Dam:

- On 7/5, one sockeye was observed on night video.
- On 7/17 & 7/18, one sockeye was observed each day.
- On 7/22, one sockeye was observed during the day shift, but it has not been confirmed via the video tape camera.

The four fish were all within the 19 to 22 inch range, and none of the sockeye were adipose clipped.

Hatchery Releases. Columbia Basin hatcheries completed release of subyearling summer and fall chinook for the year. Spring Creek Hatchery personnel will release 500,000 spring chinook into the Big White Salmon River in early to mid August.

The data presented in the following passage index section is preliminary and has been derived from various sources. For verification and/or origin of data, contact the operators of the Fish Passage Data System at (503) 230-4099.

Smolt indices, wild & hatchery or combined, are presented in the following order: yearling chinook (chinook 1's), subyearling chinook (chinook 0's), steelhead, coho, and sockeye. Two classes of fish counts are shown in these tables: collection counts, which account for sample rates but are not adjusted for flow; and passage indices, which are collection counts divided by the proportion of water passing through the sampling system. Collection counts may be constrained due to sampling effort or river flow. Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations. The classes of counts presented in the report are defined below for each site. Most samples occur over a 24 hour period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.

1996, 1997, and 1998 counts were obtained from the Corps of Engineers.

1998 totals at LMN, RIS, and RRH are based on video counts accumulated through July 22.

1998 totals at LGS are based on video counts accumulated through July 21.

Adult count records at LGS have been maintained since 1993.

** - Through June 28, all (spring) chinook are being trapped and removed from the ladder at Wells prior to the counting window.

* - 1998 John Day Steelhead counts will be revised

Transportation Summary Report

Two-Week Transportation Summary

from 07/10/98 to 07/23/98
