

Fish Passage Center

Weekly Report #99 - 12

May 28, 1999

2501 SW First Ave., Suite 230
Portland, OR 97201-4752
phone: 503/230-4582
fax: 503/230-7559

SUMMARY OF EVENTS:

Water Supply: Light showers continue over the region. Moderate snowmelt was experienced during the past week. Flows are expected to crest on May 27, then gradually decrease through the remainder of the period as temperatures cool and snowmelt decreases.

Precipitation above Coulee was 78% of normal, Snake River above Ice Harbor was 83% of normal and Columbia above The Dalles was 83% of normal for the period of May 1-25. The subbasins with the highest precipitation remained the Hood/Lower Deschutes with 150% and the Willamette Valley with 176%. The lowest precipitation was at Clark Fork with 47%, Flathead with 56%, and Harney/Malheur Basin with 56%.

The new June 99 early Runoff Volume Forecast was issued. Cold weather conditions and showery patterns persisted in the region resulting in a further deterioration of the Runoff Volumes. Changes are in the range of -10% to +2% compared to the May Final. The January-July forecast for the Columbia River above The Dalles is 124 MAF, or 117% of average, which is the same as the May Final. The runoff volume forecast for Brownlee reservoir decreased 10% and for Dworshak it decreased 5% compared to the May Final. The summary of the May Final and June Early Runoff Volume Forecasts is given in the following Table:

Location	Period	May 99 Final		June 99 Early	
		MAF	%	MAF	%
<i>Libby</i>	Apr-Sep	7.16	106	7.28	108
<i>Hungry Horse</i>	Apr-Sep	2.31	106	2.27	104
<i>Grand Coulee</i>	Jan-Jul	72.4	114	73.1	116
<i>The Dalles</i>	Jan-Jul	124	117	124	117
<i>Lower Granite</i>	Jan-Jul	35.8	120	34.9	117
<i>Dworshak</i>	Apr-Jul	3.2	119	3.08	114
<i>Brownlee</i>	Apr-Jul	7.32	126	6.73	116

System Storage: Delayed snowmelt and low precipitation will result in most of the reservoirs not attaining refill by the specified Biological Opinion dates. It is expected that August flows will be very low in spite of forecasted high

runoff volumes at the beginning of the season. Deep drafts of the reservoirs during March for flood control resulted in low spring flows given the current weather pattern. Redistribution of the drafted flood control volumes from March into April could improve spring flows and refill of the reservoirs for fish needs.

- *Hungry Horse* operated to the Integrated Rule Curves defined by the State of Montana. Projected elevation on May 31 is 3510 ft. The reservoir is projected to be full by July 31, instead of June 30 as required by Biological Opinion. This could impact flows for summer migrants. The outflows continue to be in the range of 2.8-3.35 kcfs during working days and 200 cfs during weekends. The reservoir is currently operated to prevent floods below Columbia Falls.
- *Libby* continues to refill with a minimum outflow of 4 kcfs. The reservoir is projected to be at 2450 ft by July 31 instead of 2460 ft as required by Biological Opinion. The Sturgeon pulse is not expected to commence during the coming week, as the temperatures at Bonners Ferry are still below the required 45° F. Summer flows will be significantly impacted since the lower reservoir elevation at the end of July will result in 450KAF less water for flow augmentation.
- *Arrow* reservoir decreased outflow to 25 kcfs at the end of May because of the increased outflows from Kootenai Lake downstream of the Arrow Dam. There is a requested outflow of 30 kcfs below Arrow for protecting trout redds, but because of the high Kootenai river inflows (in the range of 50 kcfs) Arrow outflow is restricted. Trout redds are being protected because of the upstream backwater effect of Kootenai River.
- *Grand Coulee* reservoir was drafted to 1213 ft to support requested flows at Priest Rapids during the week of May 13-20 and then began refilling. Inflows were in the range of 138.8 kcfs-203.6 kcfs

during the week of May 20-27. Outflows were in the range of 99.8 kcfs-135.7 kcfs during the same period.

- *Dworshak* reservoir continues to refill with minimum outflows of 1.3 kcfs-1.4 kcfs after May 20. The latest projection of the SSARR shows the reservoir will not refill by the end of July. The highest projected elevation is 1582.8 ft at the end of the second week of July before summer flow augmentation begins. Deep drafting of the reservoir for flood control during March resulted in failure of the reservoir to refill by June 30 or July 31. It is expected that flows at Lower Granite during the whole month of August will be lower than BiOp required minimum flow target of 53.96 kcfs.
- *Brownlee* reservoir was operated with outflows in the range of 26 kcfs-33.4 kcfs during May 21-26. The reservoir increased outflows to 43.3 kcfs on May 26 because of the required lower elevation for reparationment of the spill gates. Currently the reservoir is on very low flow rates (16 kcfs on May 27) in order to refill to elevation of 2037 ft by May 29 for recreation purposes for Memorial Day weekend. Inflows increased to range of 36 kcfs-47 kcfs during the past week.

A summary of the current elevations on May 27 is given in the following Table:

Reservoir	Actual elev. As of May 26	Max Reservoir pool [ft]
<i>Libby</i>	2374.07	2459
<i>Hungry Horse</i>	3507.22	3560
<i>Grand Coulee</i>	1227.95	1290
<i>Brownlee</i>	2024.14*	2077
<i>Dworshak</i>	1488.19	1600

* as of May 26

Upper Snake reservoirs:

As of May 26, American Falls is at 94% of capacity, being slightly drafted for flood control during the previous week, Palisades is at 36% of full and Jackson Lake is 70% of full. Intensive snowmelt in the region has resulted in continuation of the higher flows at Minidoka of 15.7 kcfs but also higher temperatures initiated irrigation withdrawals at Milner diversion. Resulting flows downstream of Milner are 8.2 kcfs. The system is at 72% of capacity.

Boise and Payette River Basins:

Both systems are operated for flood control, but are also refilling. The Boise River system (Anderson Ranch, Arrowrock and Lucky Peak) is at 72% of capacity. The outflow from Boise River system is 1.2 kcfs (as of May 26).

The Payette River system (Cascade, Deadwood) is at 69% of capacity. The outflow from Payette river system is 11.3 kcfs (as of May 26).

Streamflow:

Biological Opinion spring flow targets based on the April Final Runoff Volume Forecast are: 100 kcfs at Lower Granite, and 260 kcfs at McNary. The commencement of Grand Coulee refill resulted in decreased flows at Priest Rapids in the Mid-Columbia reach compared to the previous week. Flows at Lower Granite were gradually peaking during the past week. The highest flow was 189 kcfs on May 27. Average weekly flows at McNary and Lower Granite were above required BiOp required flow targets, after a prolonged period of low spring flows. Daily average flows at Priest Rapids were fluctuating in the range of 111.0 kcfs to 178.6 kcfs. The total range of daily and hourly fluctuations is presented in the following Table:

Date	Average Daily Flow at Priest Rapids [kcfs]	Hourly fluctuations [kcfs]
May 21	152.5	141.6-154.2
May 22	125.4	111.2-126.7
May 23	111.0	109.3-111.0
May 24	133.7	120.9-150.1
May 25	136.4	118.1-153.9
May 26	163.3	149.3-199.5
May 27	178.6	159.9-187.4

The average discharge for the major run-of-river projects for May 13-27 period are given in the following Table:

Project	Average Discharge [kcfs]	
	May 14-20	May 21-May 27
Priest Rapids	172.8	143.0
McNary	260.6	280.6
Lower Granite	84.8	139.8
Bonneville	273.8	302.4

Spill: Outflow from Dworshak Dam was reduced to project minimum and no spill has occurred over the past week. Flows at the Hells Canyon Complex have also been reduced to hydraulic capacity with no spill occurring. However, a problem did occur at Brownlee Dam on May 26, which resulted in flows that exceeded 50 Kcfs for nine hours with corresponding spill above hydraulic capacity. The Biological Opinion spill program is presently being implemented at the lower Snake projects. The higher flows this past week have resulted in higher volumes of spill in the Snake River leading to higher dissolved gas

levels. A unit outage at Lower Granite Dam has resulted in high spill and TDG levels at this project. It is expected back in service next week.

The FERC spill program continues at the Mid Columbia projects.

Biological Opinion spill levels continue at the lower Columbia projects. The higher flows in the lower River have also resulted in correspondingly higher spill levels at these projects.

Towards the end of the week the levels of total dissolved gas were above 115/120% TDG waivers at all the Snake River monitors, except those above Lower Granite Dam. With the exception of the John Day forebay monitor and The Dalles monitors, all other lower River sites are out of compliance. These higher gas levels are due to uncontrolled spill at this time.

Monitoring for signs of gas bubble trauma (GBT) on fish collected through the Smolt Monitoring Program showed few fish with signs of GBT over the past week. It is anticipated that the GBT monitoring program will begin seeing more fish with signs of GBT next week reflecting the recent increase in total dissolved gas levels in the **Smolt Monitoring** System. Flows at Lower Granite Dam increased to over 100 Kcfs this past week for the first time since May 5th, and the trend in the passage indices of yearling chinook and steelhead reflected this increase in flow. Hatchery chinook at Lower Granite remained fairly stable, but wild chinook numbers increased three-fold. Hatchery steelhead passage indices increased significantly at Lower Granite, peaking at over 306,000 on May 26th. Wild steelhead passage indices exhibited a similar pattern reaching over 30,000 on the same date. Little Goose saw several days this past week where hatchery chinook passage indices exceeded 100,000 and wild chinook exceeded 10,000. Lower Monumental Dam has also had several days of relatively high yearling hatchery chinook passage indices this week. Hatchery steelhead passage indices increased steadily to over 100,000 at both these sites this past week and wild steelhead to over 20,000. The Snake River trap at Lewiston completed sampling for the 1999 season on 5/25, and the Whitebird Trap finished on 5/21.

In the Mid-Columbia River, this week's daily passage indices of yearling chinook at Rock Island Dam have decreased compared to last week, while those of coho and steelhead have increased and those of sockeye have decreased. Daily flows at Rock Island Dam this

week averaged 145 kcfs, which is lower than last week's average.

In the lower Columbia River, this week has seen McNary Dam's yearling chinook passage indices remain about the same as last week. Coho and steelhead passage indices continued to increase this week at McNary Dam, while sockeye were lower. At John Day and Bonneville dams, the trend in passage indices of yearling chinook has remained relatively flat over the past two weeks, with some increase occurring late this week for coho at both dams, and steelhead at John Day. Wild sockeye passage indices hit their season highs early last week at both John Day and Bonneville dams and have shown slow decreases this past week.

Fish are presently being bypassed back to the river at Lower Granite Dam. The plan called for barging to occur on alternate days beginning May 26th. Recent high flows and the reduced hydraulic capacity at Lower Granite Dam have resulted in higher spill levels that make it difficult to bring the barge in for loading. Loading the barge for this first alternate day transport required a spill curtailment that resulted in excessive spill both before and after the barge was loaded, with total dissolved gas levels increasing to a peak of 131%. Barging will resume when spill levels can be manipulated by ponding water during barge loading (i.e. when flows decrease and project is at full hydraulic capacity), while limiting TDG to 120%.

Adult Fish Passage: Numbers of adult spring chinook passing Bonneville Dam ranged from a high count of 343 on May 25, to a low of 226 on May 23 for the week ending May 27. Total adult spring chinook was 37,415 through May 27. This total was greater than 1998 count, but remained well below the 10-year average count of 65,284. Next week will signal the start of summer chinook at Bonneville (June 1). Of the chinook past Bonneville, 16,103 have been counted at The Dalles Dam, 12,853 at John Day Dam, and 7,928 at McNary Dam. About 43 percent of the spring chinook past Bonneville Dam have moved upstream past The Dalles Dam. This compares to the 10-year average of 58% and the 1998 percentage of about 65% of the Bonneville count moving upstream.

Through May 27, a total of 3,651 adult spring chinook were counted at the lower Snake River dam (Ice Harbor) with 1,587 adult spring chinook counted at Lower Granite Dam. In the Mid-Columbia River, 3,530 adult spring chinook have been counted at Priest Rapids

Dam. Fish counts received from Rock Island Dam are through 5/27 with 2,275 tallied. At Wells Dam, all spring chinook will be captured at trapping facilities located on West and East bank fish ladders. Steelhead will be released back into the fish ladder while the chinook will be taken to hatcheries for holding until spawning. This spring chinook trapping will continue through the first week of July.

As points of interest, 1236 adult and 123 jack chinook have been counted at Prosser Dam (Yakama R) through May 22 (information from Yakama Tribe). At 3-Mile Dam in the Umatilla River, about 1,270 adult spring chinook have been tallied through May 23 (information from ODFW). At Lower Granite Dam, most adult chinook sampled through the week were reported in good condition with about 2.5% of the fish reported with some type of lesion on the head area (information from NMFS).

The number of jack chinook salmon passing Bonneville Dam surpassed 8,300 for the spring season and compare to only 707 jacks in 1998 and 2,375 for the 10-year average. Daily counts of jack spring chinook decreased through the week to near 100 per day. About 3,160 have been tallied at McNary Dam, with 1,936 counted at Ice Harbor Dam and 301 at Priest Rapids Dam. Jack counts exceed the 10-year average at all projects and are record high according to our count totals back to 1977.

At Bonneville Dam, the daily passage of steelhead ranged between 30 to 80 fish per day for the past week, with the cumulative count for the season at 2,202. Of this total, 14% or 314 were "wild" origin steelhead. New steelhead passing Bonneville at this time of year are normally destined for Bonneville tributary streams (Skamania stock).

Hatchery Releases: During the past two weeks, approximately 3.7 million anadromous salmon were released from hatcheries, acclimation ponds, or were directly planted into streams. For the upcoming two weeks, about 7.4 million salmon are scheduled for release from basin hatcheries into the rivers and tributaries above Bonneville Dam. More than 79 million juvenile salmon of hatchery origin will be released into streams above Bonneville Dam for the 1999 Migration Year. Most yearling spring, summer, and fall chinook and coho have been released from the hatcheries in each River Reach. Steelhead releases are nearly completed for the year. Releases of

subyearling bright fall chinook will be made during the next two weeks with mid-June to late June being the peak time for releasing these fish. Subyearling summer chinook will be released in the Mid-Columbia in June.

Lower Columbia River (above Bonneville Dam to McNary Dam) – The spring migrants have been released from hatcheries for the season. Subyearling fall chinook will be released over the next month in the Klickitat, Little White Salmon, and Umatilla rivers.

Mid-Columbia River – Steelhead releases are nearly completed for the year in the Mid-Columbia. All yearling chinook, coho, and chinook have been released from acclimation ponds in the Yakama River. The last of the coho from Yakama River acclimation facilities were released this past week. All hatchery sockeye have been released for the 1999 migration. Most subyearling fall and summer chinook remain to be planted from hatcheries and acclimation ponds and are scheduled for release in June. Approximately 2 million subyearling fall chinook are in the process of being released (volitional release) from the Prosser Acclimation Ponds located in the Yakama River.

Snake River – Releases of yearling spring, summer fall chinook and coho from State, Federal or Tribal hatcheries have been completed for the 1999-migration season. Steelhead releases are nearing completion for the year. Approximately 565,000 subyearling fall chinook will be released in June from Big Canyon (Clearwater drainage) and CPT John (Snake R) acclimation facilities with another 200,000 released into the Snake River Lyons Ferry Hatchery. About 10,000 sockeye (Red Fish Lake stock) were released in the upper Salmon River this spring season.

The data presented in the following passage index section is preliminary and has been derived from various sources. For verification and/or origin of data, contact the operators of the Fish Passage Data System at (503) 230-4099.

Smolt indices, wild & hatchery or combined, are presented in the following order: yearling chinook (chinook 1's), subyearling chinook (chinook 0's), steelhead, coho, and sockeye. Two classes of fish counts are shown in these tables: collection counts, which account for sample rates but are not adjusted for flow; and passage indices, which are collection counts divided by the proportion of water passing through the sampling system. Collection counts may be constrained due to sampling effort or river flow. Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations. The classes of counts presented in the report are defined below for each site. Most samples occur over a 24 hour period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

*NOTE: The data is not being received and/or not being updated in a timely fashion.

*LMN, PRD, RIS, RRH are through 05/26 and LGS is through 5/25.

*WEL - WDFW is trapping Spring Chinook on both fish ladders, so data not available at present.

*Bonneville and Lower Granite were doing video counts only until April 1, 1999. These counts were 8 hour daytime video counts.

**Adult count records at Little Goose Dam have been maintained since 1991, visual counts were not conducted at Little Goose Dam between 1982 and 1990.

*Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.

*Historic counts 1997 to present were obtained from the Corps of Engineers.

*NOTE: PRD, RIS, and RRH, are not reporting Wild Steelhead numbers.

*No Video counts at Lower Granite Dam on 3/1/99 and 3/2/99.

**Transportation Summary Report
