

## Fish Passage Center

# Weekly Report #99 - 13

June 04, 1999

2501 SW First Ave., Suite 230  
 Portland, OR 97201-4752  
 phone: 503/230-4582  
 fax: 503/230-7559

### SUMMARY OF EVENTS:

**Water Supply:** Light showers continue over the region. Temperatures are forecasted to decrease again during next week with gradually diminishing snowmelt. Minor precipitation increases were observed at Clark Fork region and Upper Snake basin during past week.

**System Storage:** The major system reservoirs are refilling toward the end of June, Opinion required, full pool elevations.

- Hungry Horse operated to the Integrated Rule Curves defined by the State of Montana. The reservoir is projected to be full by July 31, instead of June 30 as required by Biological Opinion, impacting flows for summer migrants. The outflows continue to be in the range of 2.8-3.35 kcfs during working days and 200 cfs during week-ends. The reservoir is currently operated to prevent floods below Columbia Falls.
- Libby continues to refill with a minimum outflow of 4 kcfs. The Sturgeon pulse is expected to commence once the temperatures at Bonners Ferry reach the required 45° F.
- Arrow reservoir decreased its outflow to 22-25 kcfs at the end of May because of the increased outflows from Kootenai Lake downstream of Arrow Dam. There is a requested outflow of 30 kcfs below Arrow for protecting trout redds, but because of the higher Kootenai river inflows, Arrow outflow is restricted. Trout redds are being protected because of the upstream backwater effect of the Kootenai River.
- Grand Coulee reservoir continues refilling. Inflows were in the range of 211 kcfs-217.6 kcfs during the week of May 28-June 3. Outflows were in the range of 99.8 kcfs-143.6 kcfs during the same period.

- Dworshak reservoir continues to refill with minimum outflows of 1.3 kcfs-1.4 kcfs since May 20. The latest projection of the SSARR shows the reservoir will not refill at all in 1999. The highest projected elevation is 1584 ft at the end of the second week of July before summer flow augmentation begins. Deep drafting of the reservoir for flood control during March resulted in a failure of the reservoir to refill by June 30 or July 31. It is expected that flows at Lower Granite during the whole month of August will be lower than the BiOp required minimum flow target of 53.96 kcfs.
- *Brownlee* reservoir was passing inflows in the range of 26 kcfs-46 kcfs during May 28-June 3. Inflows increased significantly during last week because of the snowmelt. The reservoir increased outflows to level of 36-46 kcfs during last week because of the required lower elevation for reparation of the spill gates. Currently, as of June 4, the reservoir will start refill toward an end of June full pool elevation.

A summary of the current elevations on June 3 is given in the following Table:

Reservoir	Actual elev. As of June 3	Max Reservoir pool [ft]
<i>Libby</i>	2390.8	2459
<i>Hungry Horse</i>	3518.5	3560
<i>Grand Coulee</i>	1245.3*	1290
<i>Brownlee</i>	2040.7*	2077
<i>Dworshak</i>	1517.6	1600

\*as of June 2

Upper Snake reservoirs:

As of June 3, American Falls is at 98% of capacity, Palisades is at 48% of full and Jackson Lake is 79% of full. All major reservoirs have been refilled because intensive snowmelt in the region resulting in higher flows at Minidoka of 20.5 kcfs. Higher temperatures initiated irrigation withdrawals at Milner diversion. Resulting flows downstream of Milner are 13.5 kcfs. The system is at 79% of capacity.

Boise and Payette River Basins:

Both systems are operated for flood control, but are also refilling. The Boise River system (Anderson Ranch, Arrowrock and Lucky Peak) is at 85% of capacity. The outflow from Boise River system is 1.8 kcfs (as of June 3).

The Payette River system (Cascade, Deadwood) is at 83% of capacity. The outflow from Payette river system is 10.5 kcfs (as of June 3).

**Streamflow:**

Biological Opinion spring flow targets based on the April Final Runoff Volume Forecast are: 100 kcfs at Lower Granite, and 260 kcfs at McNary. Moderate snowmelt finally resulted in peaking flows. Flows at Lower Granite fluctuated between 157.8 kcfs (on May 29) and 174.3 kcfs (on June 2) during the past week. It is expected that flows will recede during the coming week. McNary flows were fluctuating during the past week, from 336.6 kcfs on May 28 to 366.1 kcfs on June 2.

Daily average flows at Priest Rapids were fluctuating in the range of 156.5 kcfs to 190.4 kcfs. The total range of daily and hourly fluctuations is presented in the following Table:

Date	Average Daily Flow at Priest Rapids [kcfs]	Hourly fluctuations [kcfs]
May 28	171.2	160.6-189.9
May 29	179.4	162.1-205.7
May 30	156.5	149.0-179.4
May 31	162.1	150.8-182.6
June 1	176.4	172.6-201.8
June 2	189.0	177.0-202.7
June 3	190.4	160.6-209.1

The average discharge for the major run-of river projects for May 21-June 3 period are given in the following Table:

Project	Average Discharge [kcfs]	
	May 28-June 3	May 21-May 27
<i>Priest Rapids</i>	175.0	143.0
<i>McNary</i>	345.1	280.6
<i>Lower Granite</i>	167.0	139.8
<i>Bonneville</i>	367.2	302.4

**Spill:** Outflow from Dworshak Dam continued at project minimum with no spill occurring. Some spill occurred at the Hell's Canyon Complex this past week. The gate repairs at Brownlee required a lower pool elevation; therefore the projects were passing inflow and spilling. The repair work was completed and outflows have been reduced. The Biological Opinion spill program is presently being implemented at the lower Snake projects. The higher flows this past week have resulted in higher volumes of spill in the Snake River leading to higher dissolved gas levels.

The FERC spill program continues at the Mid Columbia projects.

Biological Opinion spill levels continue at the lower Columbia projects. The higher flows in the lower River have also resulted in correspondingly higher spill levels at these projects.

Towards the end of the week the levels of total dissolved gas were above 115/120% TDG waivers at all the Snake River monitors, except those above Lower Granite Dam. With the exception of the John Day forebay monitor and The Dalles monitors, all other lower River sites have periodically been out of compliance during the past week. These higher gas levels are due to uncontrolled spill at this time.

Monitoring for signs of gas bubble trauma (GBT) on fish collected through the Smolt Monitoring Program showed more fish with signs of GBT over the past week. However, the frequency of fin signs did not exceed the 15% criteria established by NMFS.

**Smolt Monitoring:** In general, an overall decreasing trend in wild and hatchery chinook, wild and hatchery steelhead, and coho was observed after the high passage indices that were reported last week. Hatchery chinook at Lower Granite decreased from near 10,000 fish at the beginning of the week to only 2,000 per day at week's end. Wild chinook numbers remained fairly stable over the past week with daily passage indices mostly in the 4,000 to 5,000 fish per day range. Hatchery steelhead passage indices decreased significantly to just over 20,000 on June 3<sup>rd</sup> at Lower Granite after peaking at over 306,000 on May 26<sup>th</sup>. Wild steelhead passage indices ranged between 4,000 and 9,000 over this past week. In most instances passage indices of both wild and hatchery chinook and steelhead were higher at Little Goose this past week than at Lower Granite. Hatchery sockeye passage indices increased at all the Snake River dam sampling sites, while wild sockeye passage indices were about the same as observed last week. Wild subyearling chinook were beginning to show up in higher numbers towards week's end.

The Lewiston and Whitebird traps have completed their sampling for the 1999 migration season and the Imnaha Trap has not been operating due to high flows and debris.

In the Mid-Columbia River, this week's daily passage indices of yearling chinook at Rock Island Dam remained about the same as last week, while those of coho, sockeye and steelhead showed an overall decreasing trend.

In the lower Columbia River, this week has seen McNary Dam's yearling chinook passage index decrease compared to last week. Coho and steelhead passage indices peaked on May 29<sup>th</sup> and then decreased after that date. Hatchery sockeye passage indices were higher than observed in the past several weeks, while wild sockeye passage indices continued to decline. At John Day and Bonneville dams, the trend in passage indices of yearling chinook showed decreasing numbers, with some increase occurring this week for coho at John Day and steelhead at John Day and Bonneville. Wild sockeye passage indices at both John Day and Bonneville dams continue to decline.

**Adult Fish Passage:** Summer chinook counts began June 1 at Bonneville Dam. Through June 3, the project counted 781 adult summer chinook past the project, with daily counts ranging between 217-298. So far, the summer chinook count is greater than the 1998 count but less than the 10-year average. The early segment of summer chinook at Bonneville is generally comprised of upper Snake River summer chinook, and the counts may include spring chinook that have been delayed due to high river Q or other reasons.

At Bonneville Dam, total adult spring chinook tallied through the end of May was 38,574. This total was nearly equal the 1998 count of 38,342, but was less than the 10-year average count of 66,607. Overall, the spring chinook run was greater than anticipated in some areas, such as the Bonneville pool tributaries (Wind River and Little White Salmon for example). Of the spring chinook past Bonneville, 17,563 have been counted at The Dalles Dam, 14,382 at John Day Dam, and 8,663 at McNary Dam. The conversion of fish from John Day Dam to above McNary Dam appears lower than normal based on a known number of fish counted into the Umatilla River to date of 1,540. About 45.5% of the spring chinook past Bonneville Dam have moved upstream past The Dalles Dam. This compares to the 10-year average of 59.5% and the 1998 percentage of about 65.8% of the Bonneville count moving upstream.

Through June 3, a total of 4,067 adult spring chinook were counted at the lower Snake River dam (Ice Harbor) with 1,965 adult spring chinook counted at Lower Granite Dam. In the Mid-Columbia River, 3,795 adult spring chinook have been counted at Priest Rapids Dam, with 2,741 passing Rock Island Dam by June 1. Trapping of spring chinook continues at Wells Dam.

As points of interest, 1431 adult and 175 jack spring chinook (Wild origin) have been counted at Prosser Dam in the Yakama River through May 28. This information was provided by Joel Hubble of the Yakama Tribe. At 3-Mile Dam in the Umatilla River, 1,540 adult spring chinook and 172 jack spring chinook have been tallied through June 3. ODFW provided this information.

The count of jack spring chinook is an all-time high record for the Umatilla River since re-introducing spring chinook in that basin.

At Lower Granite Dam, most adult chinook sampled through the week were reported in good condition with about 2.8% (10 of 357) displaying some type of lesion on the head area. This information was provided by NMFS.

The Columbia River Intertribal Fisheries Commission again sampled spring chinook at the Washington shore sampling facility this season. Through May 21, information from its sampling gave the following breakdown of percentage of run of each age class and mean length: jack chinook – 17% of run, ave. length = 49.2 cm; age 4 chinook – 73% of run, ave. length = 74 cm; age 5 chinook – 10% of run, ave. length = 84.6 cm. In addition, they monitor quality of fish at the site. Approximately 1% of the fish sampled were reported with headburn symptoms for the season. The percentage of chinook recorded with marine mammal wounds was 12% through May 21.

The passage of jack chinook at sites upstream of Bonneville Dam continues to be impressive. Of the 8,691 that passed Bonneville, 6,155 were tallied at The Dalles (70.8%), 4,864 at John Day, 3,699 at McNary Dam, 2,265 at Ice Harbor Dam and 572 at Priest Rapids Dam. Jack counts exceed the 10-year average at all projects and are at a record high according to our count totals going back to 1977. Prior to 1977, there were counts of jack chinook 10,000 for several year classes. However, the 4 and 5 year old chinook that return from the 1998 juvenile migration (1996 brood year) in year 2000 and 2001 could be impressive.

The first returns of adult sockeye were counted during the past week at Bonneville Dam and upstream projects.

**Hatchery Releases:** During the past two weeks, approximately 10 million anadromous salmon were released from hatcheries, acclimation ponds, or were directly planted into streams. For the upcoming two weeks, about 7.9 million salmon are scheduled for release from basin hatcheries into the rivers and tributaries above Bonneville Dam. More than 79 million juvenile salmon of hatchery origin

will be released into streams above Bonneville Dam for the 1999 Migration Year. Basically, all spring migrants, i.e., yearling spring, summer, and fall chinook, coho and steelhead have been released from the hatcheries in each River Reach. Releases of subyearling bright fall chinook will be made during the next two weeks with mid-June to late-June being the peak time for releasing these fish. Subyearling summer chinook will be released in the Mid-Columbia in June.

Lower Columbia River (above Bonneville Dam to McNary Dam) –Subyearling fall chinook will be released during this month in the Klickitat, Little White Salmon, and Umatilla (completed June 3) rivers.

Mid-Columbia River - Most subyearling fall and summer chinook are scheduled for release in June. Approximately 2 million subyearling fall chinook are in the process of being released (volitional release) from the Prosser Acclimation Ponds located in the Yakama River. Normally the Priest Rapids subyearlings are released after a representative group of “wild” fall chinook in the Hanford Reach are marked with Coded Wire Tags.

Snake River – Approximately 565,000 subyearling fall chinook will be released in June from Big Canyon (Clearwater drainage) and CPT John (Snake River) acclimation facilities, with another 200,000 released into the Snake River Lyons Ferry Hatchery.

The data presented in the following passage index section is preliminary and has been derived from various sources. For verification and/or origin of data, contact the operators of the Fish Passage Data System at (503) 230-4099.

Smolt indices, wild & hatchery or combined, are presented in the following order: yearling chinook (chinook 1's), subyearling chinook (chinook 0's), steelhead, coho, and sockeye. Two classes of fish counts are shown in these tables: collection counts, which account for sample rates but are not adjusted for flow; and passage indices, which are collection counts divided by the proportion of water passing through the sampling system. Collection counts may be constrained due to sampling effort or river flow. Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations. The classes of counts presented in the report are defined below for each site. Most samples occur over a 24 hour period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

\*NOTE: The data is not being received and/or not being updated in a timely fashion.

\*LMN and PRD are through 6/2 - LGS, MCN, RIS, and RRH are through 6/1.

\*WEL - WDFW is trapping Spring Chinook on both fish ladders, so data not available at present.

\*Bonneville and Lower Granite were doing video counts only until April 1, 1999. These counts were 8 hour daytime video counts.

\*\*Adult count records at Little Goose Dam have been maintained since 1991, visual counts were not conducted at Little Goose Dam between 1982 and 1990.

\*Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.

\*Historic counts 1997 to present were obtained from the Corps of Engineers.

\*NOTE: PRD, RIS, and RRH, are not reporting Wild Steelhead numbers.

\*No Video counts at Lower Granite Dam on 3/1/99 and 3/2/99.
