

Fish Passage Center

Weekly Report #14 - 12

June 6, 2014

847 NE 19th Ave., Suite 250
Portland, OR 97232
phone: (503) 833-3900
fax: (503) 232-1259

Summary of Events

Water Supply

Precipitation throughout the Columbia Basin has varied between 0% and 98% of average at individual sub-basins over June. Precipitation above The Dalles has been 33% of average over June. Over the 2014 water year, precipitation has ranged between 76% and 98% of average.

Table 1. Summary of June precipitation and cumulative October through June 4, 2014, precipitation with respect to average (1971–2000), at select locations within the Columbia and Snake River Basins.

Location	Water Year 2014		Water Year 2014	
	June 1–4, 2014		October 1, 2013 to June 4, 2014	
	Observed (inches)	% Average	Observed (inches)	% Average
Columbia above Coulee	0.25	59	26.9	93
Sneke River above Ice Harbor	0.02	9	14.6	79
Columbia above The Dalles	0.09	33	18.4	83
Kootenai	0.21	43	28.8	98
Clark Fork	0.09	27	17.1	80
Flathead	0.41	98	26.9	95
Pend Oreille River Basin above Waneta Dam	0.25	67	22.5	87
Salmon River Basin	0.03	9	17.5	76
Upper Snake Tributaries	0.01	6	19.3	88
Clearwater	0.06	16	30.8	91
Willamette River above Portland	0.00	0	49.2	84

Snowpack within the Columbia Basin has been variable. Average snowpack in the Columbia River for basins above the Snake River confluence is 156% of average. For Snake River Basins the average snowpack is 81% of average, and for lower Columbia Basins between McNary and Bonneville Dam average snowpack is 15% of average.

Table 2 displays the June 5th ESP runoff volume forecasts for multiple reservoirs along with the June COE forecasts at Libby and Dworshak. The June 5th ESP forecast at The Dalles between January and July is 107,109 Kaf (106% of average).

Table 2. June ESP Runoff Volume Forecasts for various reservoirs within the Columbia and Snake River Basins.

Location	June 5, 2014, 5-day QPF ESP	
	% Average (1981–2010)	Runoff Volume (Kaf)
The Dalles (Jan–July)	106	107109
Grand Coulee (Jan–July)	108	64080
Libby Res. Inflow, MT (Apr–Aug)	117	6893 7074*
Hungry Horse Res. Inflow, MT (Jan–July)	122	2559
Lower Granite Res. Inflow (Apr–July)	101	19994
Brownlee Res. Inflow (Apr–July)	61	3328
Dworshak Res. Inflow (Apr–July)	127	3080 2933*

* Denotes COE June Forecast

Grand Coulee Reservoir is at 1272.6 feet (6-5-14) and has refilled 8.2 feet over the last week. Outflows at Grand Coulee have ranged between 167.0 and 176.3 Kcfs over the last week.

The Libby Reservoir is currently at elevation 2419.5 feet (6-5-14) and has refilled 7.0 feet over the previous week. The daily average outflows at Libby Dam have been increased from 18.0 Kcfs to 26.0 over the last week for the sturgeon pulse operation.

Hungry Horse is currently at an elevation of 3530.8 feet (6-5-14) and has refilled 10.9 feet over the previous week. Outflows at Hungry Horse have been 2.3–4.5 Kcfs over the last week.

Dworshak is currently at an elevation of 1574.1 feet (6-5-14) and has refilled 10.9 feet over the previous week. Outflows at Dworshak have been 2.3–4.5 Kcfs over the last week.

The Brownlee Reservoir was at an elevation of 2075 feet on June 5, 2014. Inflows to Brownlee Dam have ranged between 16.5 and 20.3 Kcfs last week.

The Biological Opinion flow period began on April 3rd in the lower Snake River (Lower Granite). According to the April Final Water Supply Forecast (April 8, 2014), the flow objective this spring is 100 Kcfs at Lower Granite. Flows at Lower Granite Dam have averaged 122.0 Kcfs over the last week and 92.8 Kcfs over the spring season.

Based on the April Final Water Supply Forecast, the Spring Biological Opinion Flow Objectives will be 260 Kcfs at McNary Dam (which began April 10th) and 135 Kcfs at Priest Rapids Dam (which began April 10th). Over the last week, flows at McNary Dam averaged 339.7 Kcfs over the last week and 291.8 over the spring period. Flows at Priest Rapids Dam have averaged 213.0 Kcfs over the last week and 186.7 Kcfs over the spring period.

Spill

The 2014 fish spill program was initiated at the lower Snake River projects beginning on April 3rd and on April 10th at the lower Columbia River projects.

Flows increased in the Lower Snake River over the past week. Consequently, spill greater than required by the Fish Operations Plan (FOP) occurred at Lower Granite Dam throughout the past week. For most of this week, spill at Little Goose Dam was restricted to less than the 30% of total flow volume as specified in the FOP based on the TDG measurements at the Lower Monumental forebay monitor. (Spill averaged about 25%–29% over the past week.) TDG exceeded the Washington State 115% forebay criteria; however TDG at the Lower Monumental forebay monitor was significantly higher than at the upstream Little Goose tailrace for most of the week. This suggests that although spill was being restricted, the higher gas levels were not likely due to upstream spill. At Lower Monumental Dam spill was at the levels specified in

the FOP. The project changed from the bulk to uniform spill pattern on May 28th, which allows higher levels of spill to occur without exceeding the gas caps. Lower Monumental Dam returned to the bulk spill pattern on the afternoon of June 5th, at which time the spill cap was reduced from 36 Kcfs to about 26 Kcfs. On April 28th the “test-like” conditions, where spill alternates between 30% instantaneous and 45 Kcfs/Gas Cap, were initiated at Ice Harbor Dam. Excess generation spill has occurred at this project. However, without excess spill occurring, the net effect of the “test-like” operation is an overall decrease in spill levels during the implementation period.

Project	Spill Level Day/Night
Lower Granite	20 Kcfs/20 Kcfs
Little Goose	30%/30%
Lower Monumental	Gas Cap/Gas Cap
Ice Harbor	April 28–June 1: 30%/30% vs. 45 Kcfs/Gas Cap

At the Middle Columbia River projects, McNary Dam spilled above 40% due to limited hydraulic capacity and excess generation spill. At John Day Dam the testing of the 30% and 40% spill levels occurred over the past week. However, the high flows resulted in spill that often precluded meeting the 30% spill level. Spill at The Dalles Dam was generally less than 40% this week due to TDG exceeding the gas criteria. Bonneville Dam spilled above 100 Kcfs over the past week.

Project	Spill Level Day/Night
McNary	40%/40%
John Day	Testing: 30%/30% vs. 40%/40%
The Dalles	40%/40%
Bonneville	100 Kcfs/100 Kcfs

New this year is a change in the way the U.S. Army Corps of Engineers will assess whether a project is in compliance with the total dissolved gas variances in place. The States of Oregon and Washington use different methodologies to estimate the 12-hour average TDG. For Oregon, the 12-hour average is based on the 12 highest hourly TDG measurements in a single calendar day (not necessarily consecutive). For Washington, the 12-hour average is based on 12-hour rolling averages. The highest of the rolling averages is

what is reported as the 12-hour average for a given day. In 2014, the location of a TDG monitor and/or type of monitor will dictate which of these methodologies is used for compliance monitoring. The Washington methodology will apply to all the lower Snake River projects, as well as the lower Columbia River forebay monitors (since Oregon does not have a forebay TDG requirement). On any given day the compliance of the tailrace monitors at the lower Columbia River projects will be determined using either the Washington or Oregon methodology, whichever is the most restrictive, and spill may be decreased if needed.

Monitoring for signs of gas bubble trauma (GBT) occurred at Lower Granite, Little Goose, Lower Monumental, McNary, Bonneville, and Rock Island dams over the past week. At Little Goose Dam 1% of fish were detected with Rank 1 (minor) signs of GBT on 6/2; at McNary Dam 1% of fish were affected with Rank 1 signs on 6/5; and, at Rock Island Dam 7% of fish were affected with Rank 1 signs on 6/3. The action criterion for GBT is 15% of total fish with any signs of GBT in the fins, or 5% with severe signs (Rank 3 or greater).

Smolt Monitoring

Smolt monitoring is ongoing at all seven SMP dams (BON, JDA, MCN, RIS, LMN, LGS, LGR). Sampling at the Imnaha River Trap (IMN) was suspended on May 30th due to damaged equipment. Sampling at the Salmon River (WTB) and Snake River (LEW) traps was terminated after the April 21st, and May 8th samples, respectively. Sampling at the Grande Ronde River Trap (GRN) was terminated after the May 21st sample.

On average, this week's samples at Bonneville Dam (BON) were dominated by sockeye juveniles, followed closely by subyearling Chinook. However, passage of all salmonid species decreased this week at BON, when compared to last week. The daily average passage indices for sockeye and subyearling Chinook at BON this week were about 6,600 and 6,400 per day, respectively. Last week's daily average passage indices were about 27,000 for sockeye and 9,700 for subyearling Chinook. This week's daily average passage indices for yearling Chinook, steelhead, and

coho were about 5,750, 1,600, and 6,000 per day, respectively. Bonneville Dam sampled its first and only Pacific lamprey ammocoete of the 2014 season on June 1st. Finally, Pacific lamprey macrophthalmia were collected at BON every day this week. This week's daily average collection for Pacific lamprey macrophthalmia at BON was about 150 per day.

Consistent with change form 14BON001, which was approved by the Fish Passage Operations and Maintenance Committee (FPOM) on May 8, 2014, flows through the BON second powerhouse (PH2) were increased to the upper end of the 1% efficiency curve at approximately 1200 on June 2, 2014. The increase in operations at PH2 was initiated because the adult trigger identified in change form 14BON001 was met on June 1st, where adult Chinook counts at BON had exceeded collection estimates of yearling Chinook juveniles for two consecutive days. Sockeye decaling has been elevated ever since this change in PH2 operations was initiated, with descaling levels between 10.7% and 19.7% over the period of June 3rd through June 6th. In addition, subyearling Chinook mortality was elevated in the June 4th sample (6.5%) and sockeye mortality has been elevated since June 3rd (4.7% on June 4th, 5.8% on June 5th, and 6.0% on June 6th).

Passage of all salmonid species at John Day Dam (JDA) decreased this week when compared to last week. This week's daily average passage indices for yearling and subyearling Chinook at JDA were 7,800 and 6,100 per day, respectively. Last week's daily average passage indices were about 29,000 and 6,800 per day, respectively. This week's daily average passage indices for steelhead, sockeye, and coho were 3,300, 9,000, and 3,200 per day. Last week's daily average passage indices for these three species were about 11,000 for steelhead, 28,600 for sockeye, and 7,800 for coho. Finally, Pacific lamprey ammocoetes were encountered in only one of this week's samples (May 30th) while Pacific lamprey macrophthalmia were present every day this week. The daily average collection for Pacific lamprey macrophthalmia this week was about 5,300 per day.

Sampling at McNary Dam (MCN) is every-other-day for the entire 2014 SMP season. Although sockeye passage continued to decrease this week when

compared to last week, sockeye continued to be the dominate species in most of this week's collections. The daily average passage index for sockeye at MCN this week was about 9,000 per day. Last week's daily average passage index for sockeye was about 55,000 per day. Yearling Chinook, steelhead, and coho passage also decreased this week, when compared to last week. This week's daily average passage indices were 5,200 for yearling Chinook, 1,550 for steelhead, and 3,650 for coho. Last week's daily average passage indices for these three species were about 27,900, 4,050, and 7,250 per day, respectively. Subyearling Chinook passage also decreased this week, with a daily average passage index of about 7,850 per day. Finally, only Pacific lamprey macrophthalmia have been collected so far this year. Pacific macrophthalmia were encountered every day this week. The daily average collection for Pacific lamprey macrophthalmia this week was 3,125 per day.

Descaling at MCN continued to be elevated this week. For the period of May 31st through June 6th, overall descaling rates ranged from 9.0% to 10.9%. Sockeye descaling rates for this period ranged from 14.9% to 25.0%. Removal of the debris mat in the MCN forebay was completed on the afternoon of May 30th. Due to decreased descaling rates in the May 29th sample, when compared to the previous sample, seven units in the MCN powerhouse were operated at the mid-range from 1600 May 29th to 0700 on Sunday, June 1st. Descaling from the May 31st sample was 10.9% overall and 14.9% for sockeye. Beginning at 0700 on Sunday, June 1st, the seven units were increased to the normal 1% operating range through 0700 on Monday, June 2nd. Descaling in the June 2nd sample was 10.5% overall and 19.8% for sockeye. Operations returned to the mid-range from 0700 June 2nd to 1600 June 2nd and were then increased to the normal 1% range from 1600 June 2nd through 0700 June 5th. Descaling from the June 4th sample (under normal 1% operating range) was 9.0% overall and 16% for sockeye. Operations of the seven units returned to the mid-range at 0700 June 5th where they remained until at least 0700 June 6th. Descaling in the June 6th sample was 9.2% overall and 25% for sockeye. In addition, high descaling (9.7%) was observed for subyearling Chinook in the June 6th sample.

Subyearling Chinook dominated the collections

at Lower Granite Dam (LGR) this week. This week's daily average passage index for subyearling Chinook at LGR was about 30,000 per day, which is an increase over last week's daily average passage index of about 20,000 per day. Passage of yearling Chinook, steelhead, sockeye, and coho all decreased this week, when compared to last week. This week's daily average passage indices for these species were 2,400 for yearling Chinook, 9,900 for steelhead, 200 for sockeye, and 230 for coho. Pacific lamprey ammocoetes were encountered in only two of the seven samples at LGR this week. Pacific lamprey macrophthalmia were encountered only in one of this week's samples (May 31st).

This week's samples at Little Goose Dam (LGS) were dominated by subyearling Chinook. This week's daily average passage index for subyearling Chinook was 38,000 per day, which is an increase over last week's daily average passage index of just over 5,000 per day. As with LGR, passage of all other species of salmonids decreased this week, when compared to last week. This week's daily average passage indices for other salmonids at LGS were 2,100 for yearling Chinook, 7,100 for steelhead, 430 for sockeye, and 250 for coho. Last week's daily average passage indices for these species were 20,000 for yearling Chinook, 33,000 for steelhead, 820 for sockeye, and 2,500 for coho. Finally, both Pacific lamprey ammocoetes and macrophthalmia were collected at LGS most days this week. The daily average collection for Pacific lamprey ammocoetes this week was just over 100, while that for Pacific lamprey macrophthalmia was about 630 per day.

Subyearling Chinook also dominated this week's samples at Lower Monumental Dam (LMN). This week's daily average passage index for subyearling Chinook at LMN was 11,500 per day, which is a significant increase over last week's daily average passage index of only 500 per day. Passage of yearling Chinook, steelhead, sockeye, and coho all decreased this week, when compared to last week. The daily average passage indices for these species were 1,300 for yearling Chinook, 3,250 for steelhead, 440 for sockeye, and 180 for coho. Last week's daily average passage indices for these four species were 13,400, 20,000, 700, and 1,550 per day, respectively. Finally, only Pacific lamprey macrophthalmia have been collected so far this

year at LMN. Pacific macrophthalmia were encountered at LMN every day this week. The daily average collection for Pacific lamprey macrophthalmia was about 1,600 per day.

Coho continued to dominate the samples at Rock Island Dam (RIS) this week. This week's daily average passage index for coho at RIS was about 1,400 per day, which is a decrease from last week's daily average passage index of about 3,300 per day. Steelhead, sockeye, and yearling Chinook passage also decreased this week, when compared to last week. This week's daily average passage indices for these three species were about 100, 30, and 75 per day, respectively. Last week's daily average passage indices were about 500 for steelhead, 550 for sockeye, and 440 for yearling Chinook. Subyearling Chinook passage increased this week. This week's daily average passage index for subyearling Chinook was nearly 300 per day. Finally, Pacific lamprey macrophthalmia were not encountered in this week's samples at RIS.

The Imnaha River Trap (IMN) is located at river kilometer 7 and is operated by the Nez Perce Tribe. Sampling at IMN is year-round however the FPC typically receives data only from early March through June. Due to the remote nature of the trap, the Nez Perce Tribe is able to send collection data to the FPC only periodically. Therefore, data for IMN may be several days behind. Sampling at IMN was suspended on May 30th due to damaged equipment. Trapping will resume when repairs are made.

Hatchery Release

Snake River Zone: The Snake River Zone encompasses the Snake River and its tributaries from its confluence with the Columbia River to Hells Canyon Dam. Approximately 710,000 subyearling fall Chinook juveniles were scheduled for release to this zone this week. Of these, about 30% were released from Lyons Ferry Hatchery, below Little Goose Dam, on June 3rd. The other 70% were scheduled to be released from the Nez Perce Tribal Hatchery into the Clearwater River. There were no other releases scheduled for this zone this week.

An additional 710,000 subyearling fall Chinook juveniles are scheduled for release into this zone over the next 2 weeks. Of these, about 200,000 are scheduled to be released directly into the Snake River near Captain Johns Rapids Acclimation Pond. The remaining 510,000 are scheduled to be released from Nez Perce Tribal acclimation facilities in the Clearwater River Basin. There are no other releases scheduled for this zone over the next 2 weeks.

Mid-Columbia Zone: The Mid-Columbia Zone encompasses the area of the Columbia River and its tributaries from McNary Dam to Chief Joseph Dam. The only new release that was scheduled for this zone this week was a release of about 80,000 fall Chinook juveniles to the Yakima River. This Yakima River release is expected to be 100% unclipped but tagged with coded-wire tags.

Many of the volitional releases of coho and summer steelhead juveniles that began several weeks ago are scheduled to end over the next 2 weeks. In addition, approximately 7.2 million subyearling fall Chinook juveniles are scheduled for release from Priest Rapids Hatchery next week. Of these, approximately 61% are unmarked and another 8% are marked with coded-wire tags only. The remaining 31% are expected to be clipped.

Lower Columbia Zone: The Lower Columbia Zone is defined as the Columbia River and its tributaries from Bonneville Dam to McNary Dam. Two new releases of subyearling fall Chinook juveniles were scheduled for this zone this week. The first was a release of approximately 4,000,000 juveniles to the Klickitat River on or around June 1st. The second was a release of about 2,400 juveniles to the Umatilla River on or around June 5th. In addition to these new releases, the volitional release of about 209,000 yearling spring Chinook juveniles from Round Butte Hatchery on the Deschutes River that began in early April was scheduled to end this week. There are no new releases scheduled for this zone over the next 2 weeks.

Adult Passage

The summer Chinook count began June 1st at Bonneville Dam. Daily passage numbers at Bonneville Dam ranged between 1,652 and 2,471 adult summer Chinook in the last week. The 2014 summer Chinook count of 11,122 is about 1.5 times greater than the 2013 count and 1.3 times greater than the 10-year average. The 2014 Bonneville Dam summer Chinook jack count of 1,693 is 70.7% of the 2013 count and about 95% of the 10-year average count. A total of 188,083 adult spring Chinook have been counted at Bonneville Dam this year. In 2013, 83,345 adult spring Chinook were counted at Bonneville Dam for the same time period. The 2014 adult spring Chinook count at Bonneville Dam is about 2.3 times greater than the 2013 count and 1.4 times greater than the 10-year average count of 130,283. The 2014 spring Chinook jack count of 26,094 is 77.1% of the 2013 count of 33,820, while being 1.2 times greater than the 10-year average count of 22,257. At Willamette Falls 20,131 adult spring Chinook has been counted so far this year. In 2013, 18,256 adult spring Chinook were counted at Willamette. This year's count is about 1.1 times greater than the 2013 count, while being 71.8% of the 10-year average count of 28,026. As of June 6th, a total of 143,142 adult spring Chinook have been counted at The Dalles Dam and 103,480 have been counted at McNary Dam. The Dalles Dam 2014 adult spring Chinook count is about 2.1 times greater than 2013 and 1.4 times greater than the 10-year average count. The 2014 McNary Dam adult spring Chinook count is about 2.1 times greater than the 2013 count and 1.4 times greater than the 10-year average count.

The 2014 Bonneville Dam adult steelhead count of 6,267 is about 1.7 times greater than the 2013 count of 3,661 and has 165 more fish than the 10-year average count of 6,102. The 2014 Bonneville Dam adult wild steelhead count of 1,619 is about 1.7 times greater than the 2013 count of 967 and has 83 more fish than the 10-year average count of 1,536. Daily adult steelhead counts at Lower Granite Dam ranged from 2 to 10 adults per day last week. This year's Lower Granite steelhead count of 7,515 has 72 more fish than the 2013 count of 7,443, while being about 85.2% of the 10-year average count of 8,816. The 2014 Lower Granite Dam adult wild steelhead count of 3,469 has 235 more fish than the 2013 count of 3,234 and is about 1.1 times

greater than the 10-year average count of 3,155. At Willamette Falls, the 2014 count for steelhead was 12,500 as of June 2nd. This year's steelhead count is about 1.1 times greater than the 2013 count of 11,426, while being about 80% of the 10-year average count of 15,624.

Daily adult sockeye passage numbers at Bonneville Dam ranged between 10 and 192 last week. The 2014 adult sockeye count at Bonneville Dam of 489 has 61 more fish than the 2013 count, while having 81.5% of the 10-year average count.

Wanapum Dam Update

At Wanapum Dam a significant crack (65-feet long by 2-inches wide) was discovered in a spillway monolith (#4) on February 27, 2014. This discovery has led to an emergency drawdown of the Wanapum pool to an elevation range of 541–545 feet, which is over 20 feet below its typical forebay elevation. Preliminary results of an investigation by Grant PUD and its consultants has determined that the primary contributing factor to a fracture developing within the dam's spillway was a mathematical error during the pre-construction design of Wanapum Dam.

The drawdown of Wanapum pool had caused the adult fishways at Wanapum Dam to not be operational. The adult fishways exits have been approximately 10 feet above the forebay water level. Grant County has designed adult fishway retrofits that involve the use of weir boxes and chutes to deliver adult fish into the forebay of Wanapum Dam. On April 15, 2014, the weir and chute retrofit was operational at the left bank fishway. A weir and chute has also been installed at the right bank fishway at Wanapum and was operational on April 26, 2014. Grant County will not be capable of counting adult fish at the usual count stations at either the left or right bank fishways at Wanapum Dam, due to the lower than normal upper ladder flows. Grant County does have people monitoring/observing passage at the exit structures at Wanapum Dam.

Visual observations of the exit retrofits have been promising. During a Wanapum Dam site visits on May

7 and 21 and June 4, 2014, several hundred adult fish have been seen passing the left bank fishway weir and chute. During these observations, fish generally pass the left bank weir quickly and there were no signs of stress or mortality upon entry into the forebay. On the dates of observation, no adult fish have been seen passing the right bank weir structure. Grant County PUD does have plans to modify the exit chutes to include a spiral flume that will reduce the elevation of the chute outflow from approximately 10 feet down to several feet. Grant PUD plans to install the spiral flume at the left bank fishway on Monday and Tuesday June 9 and 10, 2014. The ladder outage has now been reduced to a 2-day period, depending on weather (wind).

The drawdown of Wanapum pool has also had a significant impact on the adult fishways at Rock Island Dam, operated by Chelan PUD. With the lower than normal tailrace levels, Chelan PUD has constructed extensions or denils at several ladder entrances. Chelan County PUD currently has two denils in place at the right bank fishway. A denil extension is also planned to be in place at the left bank fishway in June.

The WDFW has noticed an unusually large percentage of adult fish at the Wells Dam Trap with significant injuries. The WDFW has sampled fish from the trap at Wells Dam for approximately four weeks and the last weeks of sampling indicated that approximately 15% of fish had notable injuries. During a sample of 77 fish on June 5, 2014, 13 had significant injuries, with several that looked relatively fresh with injuries likely to have occurred within several days of being trapped at Wells Dam. The source of these injuries continues to be investigated and video counts at dams below Wells are being reviewed to narrow the source of the large/fresh injuries.

Hatchery Releases Last Two Weeks

Hatchery Release Summary									
From:	5/23/2014		to		06/05/14				
Agency	Hatchery	Species	Race	MigYr	NumRel	RelStart	RelEnd	RelSite	RelRiver

Two-Week Summary of Passage Indices

* See sampling comments <http://www.fpc.org/currentDaily/smpcomments.htm>

Smolt indices, clipped & unclipped or combined, are presented in the following order: yearling chinook (chinook 1's,) subyearling chinook (chinook 0's), steelhead, coho, sockeye, and lamprey juveniles. Two classes of fish counts are shown in these tables:

Two classes of fish counts are shown in these tables:

Sample counts (Samp) are provided for juvenile lamprey at LGR. See note below for details †.

Collection counts (Coll), which account for sample rates but are not adjusted for flow;

Passage indices (INDEX), which are collection counts divided by the proportion of water passing through the sampled powerhouse.

Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations.

The classes of counts presented in the report are defined below for each site. Most samples occur over a 24-hr period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

Combined lamprey juvenile collection counts are provided for all sites. Combined lamprey juveniles is a combination of pacific lamprey ammocoetes, brook lamprey ammocoetes, unknown lamprey ammocoetes, pacific lamprey macrophthalmia, and unidentified lamprey species.

† In 2013 it was confirmed that juvenile lamprey can escape the sample tank at LGR which would lead to unreliable estimates of collection. Therefore, only sample counts are provided in this report.

Definitions for Smolt Index Counts

WTB (Collection) = Salmon River Trap at Whitebird : Collection Counts

IMN (Collection) = Imnaha River Trap : Collection Counts

GRN (Collection) = Grande Ronde River Trap : Collection Counts

LEW (Collection) = Snake River Trap at Lewiston : Collection Counts

LGR (Index) = Lower Granite Dam Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse Flow} / (\text{Powerhouse Flow} + \text{Spill}) \}$

LGS (Index) = Little Goose Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse Flow} / (\text{Powerhouse Flow} + \text{Spill}) \}$

LMN (Index) = Lower Monumental Dam Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse Flow} / (\text{Powerhouse Flow} + \text{Spill}) \}$

RIS (Index) = Rock Island Dam Second Powerhouse Bypass Trap : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse 2 Flow} / (\text{Powerhouse 1 \& 2 Flow} + \text{Spill}) \}$

MCN (Index) = McNary Dam Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse Flow} / (\text{Powerhouse Flow} + \text{Spill}) \}$

JDA (Index) = John Day Dam Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse Flow} / (\text{Powerhouse Flow} + \text{Spill}) \}$

BO2 (Index) = Bonneville Dam Second Powerhouse Bypass Collection System : Passage Index Counts

Passage Index = $\text{Collection Counts} / \{ \text{Powerhouse 2 Flow} / (\text{Powerhouse 1 \& 2 Flow} + \text{Spill}) \}$

JDA and BO2 data collected for the FPC by Pacific States Marine Fisheries Commission.

RIS data collected for the FPC by Chelan Co. PUD.

LGR, LMN, and MCN data collected for the FPC by Washington Dept. of Fish and Wildlife.

LGS and GRN data collected for the FPC by Oregon Dept. of Fish and Wildlife.

IMN data collected for the FPC by the Nez Perce Tribe.

Fall (post SMP season) trapping at the Imnaha River Fish Trap (IMN) is funded by the Lower Snake River Compensation Program (LSRCP)

WTB and LEW data collected for the FPC by Idaho Dept. of Fish and Game.

PRD does not post wild steelhead numbers.
 These numbers were collected from USACE, Grant PUD, Douglas PUD, Chelan PUD, ODFW and DART.
 Wild steelhead numbers are included in the total. Wild Steelhead are defined as unclipped fish.
 Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.
 Historic counts 1997 to present were obtained from the Corps of Engineers.
