

Fish Passage Center

Weekly Report #15–15

June 26, 2015

Summary of Events

Water Supply

Precipitation throughout the Columbia Basin has varied between 23% and 65% of average at individual sub-basins over June. Precipitation above The Dalles has been 47% of average over early June. Over the 2015 water year, precipitation has ranged between 75% and 97% of average.

Table 1. Summary of June precipitation and cumulative October through June precipitation with respect to average (1971–2000) at select locations within the Columbia and Snake River Basins.

Location	Water Year 2015		Water Year 2015	
	June 1–24, 2015		October 1, 2014 to June 24, 2015	
	Observed (inches)	% Average	Observed (inches)	% Average
Columbia above Coulee	1.55	60	29.9	96
Sneke River above Ice Harbor	0.49	38	15.6	80
Columbia above The Dalles	0.78	47	20.2	85
Kootenai	1.88	65	30.9	97
Clark Fork	0.57	29	17.3	75
Flathead	1.20	48	26.7	88
Pend Oreille River Basin above Waneta Dam	0.90	40	22.9	82
Salmon River Basin	0.77	39	19.2	78
Upper Snake Tributaries	0.80	58	17.8	77
Clearwater	0.75	31	29.2	81
Willamette River above Portland	0.46	23	48.6	81

Table 2 displays the June 24th ESP runoff volume forecasts for multiple reservoirs along with the June COE forecasts at Libby and Dworshak. The June 24th ESP forecast at The Dalles between April and August is 58,109 Kaf (66% of average).

Table 2. June ESP Runoff Volume Forecasts for various reservoirs within the Columbia and Snake River Basins.

Location	June 24, 2015 5-day QPF ESP	
	% Average (1981–2010)	Runoff Volume (Kaf)
The Dalles (Apr–Aug)	66	58,109
Grand Coulee (Apr–Aug)	74	41,826
Libby Res. Inflow, MT (Apr–Aug)	75 86*	4,389 5,090*
Hungry Horse Res. Inflow, MT (Apr–Aug)	66	1,276
Lower Granite Res. Inflow (Apr–July)	51	10,124
Brownlee Res. Inflow (Apr–July)	43	2,366
Dworshak Res. Inflow (Apr–July)	47 42*	1,132 1,113*

* Denotes COE June Forecast

Grand Coulee Reservoir is at 1,282.1 feet (6-24-15) and has refilled 6.8 feet over the last week. Outflows at Grand Coulee have ranged between 72.8 and 88.3 Kcfs over the last week.

The Libby Reservoir is currently at elevation 2,441.8 feet (6-24-15) and has refilled 1.2 feet over the previous week. Daily average outflows at Libby Dam have been 11.5 Kcfs over the last week.

Hungry Horse is currently at an elevation of 3,549.9 feet (6-24-15) and refilled 0.2 feet over the last week. Outflows at Hungry Horse have been 2.3 to 2.5 Kcfs over the last week.

Dworshak is currently at an elevation of 1,596.0 feet (6-24-15) and drafted 2.9 feet over the last week. Outflows have increased from 5.3 to 8.5 Kcfs over the last week.

The Brownlee Reservoir was at an elevation of 2,075.9 feet on June 24, 2015, and has held steady over the last week. Hells Canyon outflows have ranged between 7.2 and 14.1 Kcfs over the last 4 days.

The Spring Biological Opinion flow period began on April 3rd and ended June 20th in the lower Snake River (Lower Granite). According to the April Final Water Supply Forecast (April 8, 2015), the flow objective this spring was 85 Kcfs at Lower Granite. Flows at Lower Granite Dam averaged 53.3 Kcfs over the spring season and 32.1 Kcfs last week. The Summer Biological Opinion flow period began on June 21st with a flow objective of 50 Kcfs. Between June 21 and June 24, 2015, flows at Lower Granite Dam were 30.9 Kcfs.

Based on the April Final Water Supply Forecast, the Spring Biological Opinion Flow Objectives (which began April 10th) will be 220 Kcfs at McNary Dam and 135 Kcfs at Priest Rapids Dam. Over the spring season, flows at McNary Dam have averaged 174.2 Kcfs, and Priest Rapids Dam flows have averaged 114.9 Kcfs. Over the last week, flows at McNary have averaged 126.7 Kcfs and averaged 91.7 Kcfs at Priest Rapids.

Spill

The 2015 spring fish spill program was implemented at the lower Snake River projects beginning on April 3rd, and beginning April 10th at the middle Columbia River projects. Spring spill at the Snake River projects ended on June 20th, with summer spill volumes being initiated on June 21st. At the middle Columbia River projects, summer spill was initiated on June 16th as part of rolled-over court ordered operations.

At the lower Snake River projects spill has been implemented according to the 2015 Fish Operations Plan (2015 FOP) over the past week. With the initiation of summer spill volumes at the Snake River projects on June 21st, spill at Lower Granite Dam switched from 20 Kcfs to 18 Kcfs. Due to low flow conditions, spill at Little Goose Dam was changed from an instantaneous 30% level to a fixed spill volume on June 16th. This

change is specified in the 2015 FOP. However, the 2015 FOP did not provide details as to when the fixed spill volume would switch between the specified 11, 9, and 7 Kcfs levels. A fixed spill volume of 11 Kcfs was provided from June 16th to June 22nd, at which time spill was reduced to 9 Kcfs. On June 23rd, spill was further reduced to 7 Kcfs and on June 24th spill fluctuated between 7, 9, and 11 Kcfs throughout the 24-hour period. These fluctuating spill levels were discussed at the June 24th Technical Management Team (TMT) meeting. On June 25th, the TMT met again and the Salmon Managers proposed criteria that clarified when the specified spill levels would be provided. These criteria were approved at the June 25th meeting and are as follows: (1) at daily average outflows of ≥ 28 Kcfs but < 32 Kcfs, a constant 11 Kcfs spill will be provided, (2) at daily average outflows of ≥ 24 Kcfs but < 28 Kcfs, a constant 9 Kcfs spill will be provided, (3) at daily average outflows of < 24 Kcfs, a constant 7 Kcfs spill will be provided, and (4) when 7 Kcfs spill is not possible, spill will be total outflow minus powerhouse minimums. Daily average outflow will be based on the previous day's 24-hour average outflow at Little Goose Dam.

Summer spill volumes at Lower Monumental Dam are 17 Kcfs, which have been met throughout the past week. On April 28th the "test-like" conditions, where spill alternates between 30% instantaneous and 45 Kcfs/Gas Cap, were initiated at Ice Harbor Dam. The net effect of this operation is a decrease in spill levels during the "test-like" period. As flows continue to decrease in the Snake River, the spill operations specified for Lower Granite, Lower Monumental, and Ice Harbor dams will likely change to spilling all water above that needed to operate one turbine unit. This has already occurred sporadically at Lower Granite and Lower Monumental this week and routinely at Ice Harbor on 45 Kcfs/Gas Cap days.

Project	Spring Spill Level (April 3-June 20) Day/Night	Summer Spill Level (June 21-August 31) Day/Night
Lower Granite	20 Kcfs/20 Kcfs	18 Kcfs/18 Kcfs
Little Goose	30%/30%	30%/30%
Lower Monumental	Gas Cap/Gas Cap	17 Kcfs/17 Kcfs
Ice Harbor	April 3-27: 45 Kcfs/Gas Cap April 28-June 20: 30%/30% vs. 45 Kcfs/Gas Cap	June 21-July 13: 30%/30% vs. 45 Kcfs/Gas Cap July 13-August 31: 45 Kcfs/Gas Cap

Since spill began on April 10th, spill for fish passage at the middle Columbia River projects occurred as described in the 2015 FOP. All projects are currently spilling to summer spill levels.

Project	Spring Spill Level (April 10-June 15) Day/Night	Summer Spill Level (June 16-August 31) Day/Night
McNary	40%/40%	50%/50
John Day	April 10–April 28: 30%/30% April 29–June 15: 30%/30% and 40%/40%	June 16–July 20: 30%/30% and 40%/40% July 20–August 31: 30%/30%
The Dalles	40%/40%	40%/40%
Bonneville	April 10–June 15: 100 Kcfs/100 Kcfs	June 16–Aug 31: 85 Kcfs/121 Kcfs and 95 Kcfs/95 Kcfs

Due to anticipated increases in power demand, the spill schedules at John Day and Ice Harbor dams were changed this week. At Ice Harbor, two 2-day blocks of 45 Kcfs/Gas Cap spill were changed to 30%/30% spill. This effectively means that spill at Ice Harbor will be 30% for 10 consecutive days (June 25–July 5). The intended 45 Kcfs/Gas Cap spill will be shifted to later in July (July 7–9 and July 11–13), resulting in 8 consecutive days of 45 Kcfs/Gas Cap spill (July 5–13) before the operation at Ice Harbor becomes 45 Kcfs/Gas Cap for the rest of the spill season. At John Day, two 2-day blocks of 40% spill were changed to 30% spill. This effectively means that spill at John Day will be 30% for 10 consecutive days (June 22–July 2). The intended 40% spill will be shifted to later in July (July 4–6 and July 8–10), resulting in 10 consecutive days of 40% spill in July (July 2–12).

Over the past week TDG measurements have been within all waiver limits at all of the TDG monitors. **Note:** The State of Oregon and the State of Washington use different methodologies to estimate the 12-hour average TDG. For Oregon, the 12-hour average is based on the 12 highest hourly TDG measurements in a single calendar day (not necessarily consecutive). For Washington, the 12-hour average is based on 12-hour rolling averages. The highest of the rolling averages is what is reported as the 12-hour average for a given day. The location of a TDG monitor will dictate which of these methodologies is used for compliance monitoring. The Washington methodology will apply to all the lower Snake River projects, as well as the middle Columbia River forebay monitors. On any given day the compliance of the tailrace monitors at the middle Columbia River projects will be determined using either the Washington or Oregon methodology, whichever

is the most restrictive, and spill will be decreased if needed.

Monitoring for signs of gas bubble trauma (GBT) occurred at Little Goose, Lower Monumental, McNary, Bonneville and Rock Island dams over the past week. Monitoring at Lower Granite Dam ended for the season due to low fish numbers. No fish were detected over the past week with signs of GBT.

Smolt Monitoring

All Smolt Monitoring Program bypass facilities continued sampling this week. Sampling at the Snake River, Salmon River, and Grande Ronde River traps has been terminated for the season. Sampling at the Imnaha River Trap is ongoing.

Passage of spring migrants (i.e., yearling Chinook, steelhead, coho, and sockeye) was low at all of the SMP sites this week. Subyearling Chinook dominated the collections at all the SMP dam sites this week. When compared to last week, subyearling Chinook passage decreased at the Snake River sites, except Little Goose Dam. Subyearling Chinook passage increased at all three Lower Columbia River sites this week. At the Upper Columbia site (RIS), subyearling Chinook passage this week was similar to last week.

This week's samples at Bonneville Dam (BON) were dominated by subyearling Chinook. This week's daily average passage index was nearly 10,000 which was an increase over last week's daily average passage index of about 7,800. With exception of steelhead, passage of spring migrants all decreased this week. This week's daily average passage indices for yearling Chinook,

coho, and sockeye were 100, 150, and 50 per day, respectively. Last week's daily average passage indices were 340 for yearling Chinook, 600 for coho, and 110 for sockeye. This week's daily average passage index for steelhead at BON was nearly 400 per day, which is a slight increase over last week's daily average passage index of 300. Finally, Pacific lamprey macrophthalmia were encountered in four of the seven sample days this week. No ammocoetes were collected this week. Several days this week had relatively high levels of sample mortality for subyearling Chinook at BON. Among the highest mortality levels were 9.9% on June 21st, 5.4% on June 23rd and 4.9% on June 24th. The cause of the elevated mortality levels is unknown.

Subyearling Chinook continued to dominate the collections at John Day Dam (JDA) this week. This week's daily average passage index for subyearling Chinook was nearly 34,000 per day, which is an increase over last week's daily average passage index of about 26,000 per day. Passage of spring migrants continued to decrease this week, when compared to the previous week. This week's daily average passage indices for spring migrants were about 300 for yearling Chinook, 70 for coho, 40 for sockeye, and 40 for steelhead. Pacific lamprey macrophthalmia were encountered in five of this week's samples, with a daily average collection for the week of about 90 per day. This is a decrease over last week's daily average collection of nearly 400 macrophthalmia per day. Finally, mortality levels for subyearling Chinook at JDA remained elevated this week, ranging from 1.0% to 3.8%. The Corps of Engineers has continued to investigate the issue but no clear cause has been found.

Since McNary Dam (MCN) is no longer a transportation site, sampling takes place every other day for the entire SMP season. This week's samples at MCN were dominated by subyearling Chinook. This week's daily average passage index for subyearling Chinook was nearly 54,000, which is an increase over last week's daily average passage index of about 41,500. With exception to steelhead, passage of spring migrants decreased this week, when compared to the previous week. This week's passage index for steelhead was about 700 per day, which was very similar to the daily average passage index from last week. Finally, Pacific lamprey macrophthalmia were encountered in all three of this week's samples. The daily average

collection for lamprey macrophthalmia this week was about 400, which is an increase over last week's daily average collection of 325. To date, MCN has not sampled any pacific lamprey ammocoetes for 2015.

Samples at Lower Granite Dam (LGR) continued to be dominated by subyearling Chinook juveniles this week. This week's daily average passage index for subyearling Chinook at LGR was about 10,900, which was a slight decrease over last week's daily average passage index of nearly 12,500 fish per day. Passage of spring migrants was very low this week. Finally, Pacific lamprey macrophthalmia were encountered in three of this week's samples. Sample counts on these three days ranged from 2 to 5 fish per day.

Sampling at Little Goose Dam (LGS) was limited to a 24-hour sample every other day from April 2nd to April 30th. Little Goose Dam began collecting fish for transportation on May 1st and, therefore, collections at LGS are every day for the rest of the season. Subyearling Chinook dominated this week's samples at LGS. This week's daily average passage index for subyearling Chinook at LGS was nearly 20,000 fish per day, which is an increase from last week's daily average passage index of about 14,350 per day. Passage of spring migrants continued to decrease this week. The daily average passage indices of spring migrants were 40 for yearling Chinook, 20 for coho, and 270 for steelhead. No sockeye were encountered in this week's samples. Finally, both Pacific lamprey ammocoetes and macrophthalmia were encountered in at least some of this week's samples. Ammocoetes were encountered twice this week and macrophthalmia were encountered in five samples.

Sampling at Lower Monumental Dam (LMN) was limited to a 24-hour sample every third day from April 4th to April 13th and every other day from April 15th to May 1st. At 1500 on May 1st, LMN began collecting fish for transportation and, therefore, collections at LMN are every day for the rest of the season. As with the last several weeks, this week's samples at LMN were dominated by subyearling Chinook, with a daily average passage index of about 4,100 per day. This is a decrease over last week's daily average passage index of about 7,100 per day. Passage of spring migrants was very low this week. Finally, Pacific lamprey macrophthalmia were encountered in four of this week's

samples. No ammocoetes were encountered at LMN this week.

SMP samples at Rock Island Dam (RIS) continued to be dominated by subyearling Chinook juveniles this week. This week's daily average passage index was about 260 fish per day, which was similar to last week's daily average passage index of about 230 per day. Passage of spring migrants was extremely low this week. Finally, Pacific lamprey macropthalmia were encountered in five of this week's seven samples.

The Imnaha River Trap (IMN) is located at river kilometer 7 and is operated by the Nez Perce Tribe. Sampling at IMN is year-round, however the FPC typically receives data only from early March through June. Due to the remote nature of the trap, the Nez Perce Tribe is able to send collection data to the FPC only periodically. Therefore, data for IMN may be several days behind. To date, we have received data through June 22nd. Over the last week of available data (June 16–22), collections at IMN were dominated by yearling Chinook, with a daily average collection of just over 100 fish per day. This is a decrease over the daily average collection from the previous week of data (June 9–15), which was about 150 per day. Steelhead passage over the June 16–22 period was very low. The daily average collection for the June 16–22 period was only four fish per day.

Hatchery Release

Snake River Zone: The Snake River Zone encompasses the Snake River and its tributaries from its confluence with the Columbia River to Hells Canyon Dam. No new releases were scheduled for this zone this week and no new releases are scheduled over the next 2 weeks.

Mid-Columbia Zone: The Mid-Columbia Zone encompasses the area of the Columbia River and its tributaries from McNary Dam to Chief Joseph Dam. One new release began this week. On June 22nd, Ringold Springs Hatchery began a volitional release of about 3.5 million subyearling fall Chinook. Previous week's weekly reports incorrectly reported this release as having started on June 10th. All of these subyearling Chinook from this Ringold Hatchery release are adipose clipped. This volitional release is

expected to run through early July. In addition to this new release, the volitional release of about 7.0 million subyearling fall Chinook from Priest Rapids Hatchery was scheduled to end this week. A large portion (55%) of the Priest Rapids Hatchery release were expected to have marks that are not externally visible (e.g., otolith and/or CWT), which means that they will not be distinguishable from wild fish. No new releases of juvenile salmonids are scheduled to begin in this zone over the next 2 weeks.

Lower Columbia Zone: The Lower Columbia Zone is defined as the Columbia River and its tributaries from Bonneville Dam to McNary Dam. No new releases were scheduled for this zone this week. Approximately 4.5 million subyearling fall Chinook are scheduled to be released from Little White Salmon NFH, beginning on or around July 2nd. No other releases of juvenile salmonids are scheduled for this zone over the next 2 weeks.

Adult Passage

The summer Chinook count began June 1st at Bonneville Dam. Daily passage numbers at Bonneville Dam ranged between 2,605 and 4,649 adult summer Chinook in the last week. The 2015 summer Chinook count of 82,625 is about 1.3 times greater than the 2014 count and 1.6 times greater than the 10-year average. The 2015 summer Chinook jack count of 9,442 is about 81.5% of the 2014 count and 85.2% of the 10-year average count. At Willamette Falls, 49,805 adult spring Chinook have been counted so far this year. In 2014, 25,059 adult spring Chinook were counted at Willamette Falls. This year's count is about two times greater than the 2014 count and 1.7 times greater than the 10-year average count of 28,644. As of June 24th, a total of 34,731 adult summer Chinook have been counted at McNary Dam and 5,483 have been counted at Lower Granite Dam. The 2015 McNary Dam adult summer Chinook count has 1,367 more fish than the 2014 count, while being 1.3 times greater than the 10-year average count. The 2015 Lower Granite Dam adult summer Chinook count has 736 more fish than the 2014 count, while having 355 fewer fish than the 10-year average count.

The 2015 Bonneville Dam adult steelhead count of 9,103 is 72.3% of the 2014 count of 12,587 and

78.5% of the 10-year average count of 11,599. The 2015 Bonneville Dam adult wild steelhead count of 4,159 has 273 more fish than the 2014 count of 3,886 and 945 more fish than the 10-year average count of 3,214. Daily adult steelhead counts at Lower Granite Dam ranged from 4 to 11 adults per day last week. This year's Lower Granite steelhead count of 9,271 is about 1.2 times greater than the 2014 count of 7,691 and has 339 more fish than the 10-year average count of 8,932. The 2015 Lower Granite Dam adult wild steelhead count of 4,373 is 1.2 times greater than the 2014 count of 3,499 and is about 1.3 times greater than the 10-year average count of 3,255. At Willamette Falls, the 2015 count for steelhead was 6,778 as of June 24th. This year's steelhead count is about 34.2% of the 2014 count of 19,827 and about 35.5% of the 10-year average count of 19,112.

Daily adult sockeye passage numbers at Bonneville Dam ranged between 13,692 and 31,880 last week. The 2015 adult sockeye count at Bonneville Dam of 244,344 is 1.3 times greater than the 2014 count and 2.2 times greater than the 10-year average count. The 2015 adult sockeye count at McNary Dam of 100,483 is 1.7 times greater than the 2014 count and 2.9 times greater than the 10-year average count. The Lower Granite Dam 2015 adult sockeye count of 36 has 25 more fish than the 2014 count of 11 and 35 more fish than the 10-year average. As of June 25th at Bonneville Dam, the adult shad count was 1,476,570. This year's shad count is about 59.1% of the 2014 count of 2,497,908 and 66.4% of the 10-year average count of 2,222,746.

Two-Week Summary of Passage Indices

* See sampling comments

<http://www.fpc.org/currentDaily/smpcomments.htm>

Smolt indices, clipped & unclipped or combined, are presented in the following order: yearling chinook (chinook 1's,) subyearling chinook (chinook 0's), steelhead, coho, sockeye, and lamprey juveniles. Two classes of fish counts are shown in these tables:

Two classes of fish counts are shown in these tables:

Sample counts (Samp) are provided for juvenile lamprey at LGR. See note below for details †.

Collection counts (Coll), which account for sample rates but are not adjusted for flow;

Passage indices (INDEX), which are collection counts divided by the proportion of water passing through the sampled powerhouse.

Passage indices are not population estimates, but are used to adjust collection counts for daily fluctuations in the site's or project's operations.

The classes of counts presented in the report are defined below for each site. Most samples occur over a 24-hr period that spans two calendar days. In this report, the date shown corresponds with the sample end date.

Combined lamprey juvenile collection counts are provided for all sites. Combined lamprey juveniles is a combination of pacific lamprey ammocoetes, brook lamprey ammocoetes, unknown lamprey ammocoetes, pacific lamprey macrophthalmia, and unidentified lamprey species.

† In 2013 it was confirmed that juvenile lamprey can escape the sample tank at LGR which would lead to unreliable estimates of collection.

Therefore, only sample counts are provided in this report.

Definitions for Smolt Index Counts

WTB (Collection) = Salmon River Trap at Whitebird : Collection Counts

IMN (Collection) = Imnaha River Trap : Collection Counts

GRN (Collection) = Grande Ronde River Trap : Collection Counts

LEW (Collection) = Snake River Trap at Lewiston : Collection Counts

LGR (Index) = Lower Granite Dam Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse Flow / (Powerhouse Flow + Spill)}

LGS (Index) = Little Goose Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse Flow / (Powerhouse Flow + Spill)}

LMN (Index) = Lower Monumental Dam Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse Flow / (Powerhouse Flow + Spill)}

RIS (Index) = Rock Island Dam Second Powerhouse Bypass Trap : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse 2 Flow / (Powerhouse 1 & 2 Flow + Spill)}

MCN (Index) = McNary Dam Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse Flow / (Powerhouse Flow + Spill)}

JDA (Index) = John Day Dam Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse Flow / (Powerhouse Flow + Spill)}

BO2 (Index) = Bonneville Dam Second Powerhouse Bypass Collection System : Passage Index Counts

Passage Index = Collection Counts / {Powerhouse 2 Flow / (Powerhouse 1 & 2 Flow + Spill)}

JDA and BO2 data collected for the FPC by Pacific States Marine Fisheries Commission.

RIS data collected for the FPC by Chelan Co. PUD.

LGR, LMN, and MCN data collected for the FPC by Washington Dept. of Fish and Wildlife.

LGS and GRN data collected for the FPC by Oregon Dept. of Fish and Wildlife.

IMN data collected for the FPC by the Nez Perce Tribe.

Fall (post SMP season) trapping at the Imnaha River Fish Trap (IMN) is funded by the Lower Snake River Compensation Program (LSRCP)

WTB and LEW data collected for the FPC by Idaho Dept. of Fish and Game.

PRD does not post wild steelhead numbers.
 These numbers were collected from USACE, Grant PUD, Douglas PUD, Chelan PUD, ODFW and DART.
 Wild steelhead numbers are included in the total. Wild Steelhead are defined as unclipped fish.
 Historic counts (pre-1996) were obtained from CRITFC and compiled by the FPC.
 Historic counts 1997 to present were obtained from the Corps of Engineers.
